Refer to [www.dialogic.com](http://www.dialogic.com) for product updates and for information about support policies, warranty information, and service offerings.
Welcome

This User’s Guide provides information about the Dialogic® PowerMedia™ Extended Media Server (also referred to herein as "PowerMedia XMS" or "XMS") Media Sessions Markup Language (MSML) software.

The MSML Media Server software enables a remote client, also known as an application server (AS), to control media resources on a media server (MS). The connection between the AS and MS is established using the SIP protocol, thereafter media control commands/responses (in the form of MSML control syntax) are exchanged in SIP messages, such as the INFO message or the 200 OK response.
About This Publication

The following topics provide information about this publication.

- Purpose
- Scope
- Intended Audience
- How to Use This Publication
- Related Information

Purpose

This publication documents the Media Server Markup Language (MSML) Media Control Interface software that provides an interface between an application server (AS) and Dialogic's host-based Media Server (MS).

This publication is for users of the MSML Media Server Software who choose to write applications that require remote control management of MS resources available on platforms running Dialogic® PowerMedia™ Extended Media Server (also referred to herein as "PowerMedia XMS" or "XMS").

Additionally, this publication documents Dialogic's compliance with the RFC 5707 MSML specification, describing extensions, deviations, and/or omissions from the standard. RFC 5707 is considered the normative implementation reference that readers and developers should consult in conjunction with this guide.

Scope

The MSML Media Server Software functionality is being provided in a phased approach. A phase typically introduces support for a previously unsupported package(s), element(s) or attribute(s). This publication documents the functionality provided by the current set of supported MSML packages as described in RFC 5707 as implemented in this version of the MSML Media Server Software.

This includes the following packages:

- MSML Core Package
- MSML Conferencing Core Package
- MSML Dialog Base Package
- MSML Dialog Core Package
- MSML Dialog Fax Detect Package
- MSML Dialog Group Module Package (parallel topology only)
- MSML Dialog Speech Package
- MSML Dialog Transform Primitives Module Package (gain only)

Functionality that is not supported by the current implementation phase includes:

- MSML Dialog Fax Send / Receive Package

Future implementation phases are planned to provide additional MSML support.
**Intended Audience**
This publication is for:
- System Integrators
- Independent Software Vendors (ISVs)
- Value Added Resellers (VARs)
- Original Equipment Manufacturers (OEMs)

This publication assumes that the reader is familiar with the Session Initiation Protocol (SIP) as defined in RFC 3261.

**How to Use This Publication**
This publication is divided into the following sections:
- **MSML Media Server Software Overview** describes the role of the MSML Media Server Software in a Media Server environment.
- **Configuration** explains how to configure the MSML Media Server Software for operation on a Media Server.
- **Feature and Protocol Package Support** specifies high-level feature support by platform and identifies packages, elements, and attributes (as documented in the RFC 5707 MSML specification) currently supported or not supported by the MSML Media Server Software.
- **Deviations** explains deviations from the RFC 5707 MSML specification.
- **Feature Details** provides details on features supported, including a feature description and how-to information.
- **Sample Use Case** presents an application that demonstrates many of the features currently supported by the MSML Media Server Software.
- **Diagnostics** describes the logging capabilities available to the MSML Media Server Software for diagnostic purposes.
- **Media Server Markup Language (MSML) Overview** provides a high-level introduction to MSML.
- A **Glossary** can be found at the end of the document.

**Related Information**
See the following for additional information:
- [http://www.dialogic.com/manuals](http://www.dialogic.com/manuals) (for Dialogic® product documentation)

- [http://www.dialogic.com](http://www.dialogic.com) (for Dialogic® product information)
1. MSML Media Server Software Overview

This chapter provides an overview of the MSML Media Server Software. Topics include:

- Introduction
- Media Server Operating Model

Introduction

The MSML Media Server Software is an integral part of the system software provided by PowerMedia XMS.

When the Dialogic® system software is installed on a media server (MS), the MSML Media Server Software enables a remote client, also known as an application server (AS), to control media resources.

**Note:** The MSML Media Server Software is based on the Media Server Markup Language (MSML) as defined in the RFC 5707 MSML specification, which combines the original MSML and Media Object Markup Language (MOML) drafts.

The connection between the AS and MS is established using the SIP protocol; thereafter, media control commands/responses (in the form of MSML control syntax) are exchanged in SIP messages, such as the INFO message or the 200 OK response.

Media Server Operating Model

Figure 1 shows an environment where the media server (MS) and application server (AS) operate as separate entities. The MSML Media Server Software runs on the MS and provides the interface between the AS and the MS as shown. The MS is responsible for media processing only; call control is the responsibility of the AS.

The AS, as a MSML client, must be capable of interpreting and generating MSML control syntax and must support the SIP INVITE, 200 OK, ACK, BYE and INFO messages.

The MSML interface uses SIP INFO messages to send MSML script payloads.

2. Configuration

This chapter discusses configuration topics, such as how to configure PowerMedia XMS to use the MSML Media Server Software.

- Configuring PowerMedia XMS
- Configuring MSML

Configuring PowerMedia XMS

MSML installation can be verified with `moml=file:///var/lib/xms/msml/verification.moml` parameter in the SIP INVITE Request URI. Playing the verification prompt is an indication of a successful installation.

PowerMedia XMS configuration and operation is done through a secure web-based operator console called the PowerMedia XMS Admin Console (also referred to herein as "Console").

The Console can be reached using a web browser and the PowerMedia XMS IP address. For more information on how to access and use the Console, see the *Dialogic® PowerMedia™ XMS Installation and Configuration Guide*.

Configuring MSML

The MSML interface (RFC 5707) uses SIP INFO messages to send MSML script payloads.

The **MSML** menu contains tabbed pages, **MSML Configuration** and **MSML Advanced Configuration**.

For more information on how to configure MSML, see the *Dialogic® PowerMedia™ XMS Installation and Configuration Guide*. 
3. Feature and Protocol Package Support

This chapter describes the high-level features supported by the current version of the MSML Media Server Software, MSML protocol support, and other related topics.

- Feature Highlights
- Media Server Markup Language (MSML) Protocol Package Support
- MSML Support Details

Feature Highlights

The MSML Media Server Software level of support varies in conjunction with the associated PowerMedia XMS platform which it uses to provide media operations and services. Table 2 presents the high-level features and functionality supported in the current version of the MSML Media Server Software with respect to Dialogic platforms.

As new features and functionality are introduced, this table will be updated to reflect the latest supported capability.

Table 2. High-Level Feature Summary

Media Server Markup Language (MSML) Protocol Package Support

The following section describes the current level of support for MSML Packages and the elements and attributes defined within each MSML Package. Supported items are shown in black text; unsupported items are shown in red text. The "Comment" column indicates restrictions or limitations that the current version of the MSML Media Server Software imposes.

Table 2 shows the high-level support view for the complete set of packages as defined in RFC 5707. Additional details are provided in subsequent tables describing element and attribute level support for each package available.

Note: The level of support is correlated against the IETF standard RFC 5707 Media Server Markup Language.

**MSML Support Details**

The following sections provide details about MSML support.

**MSML Core Package Support**

For list of supported MSML Core Package elements, see [MSML Core Package Support](#).

**MSML Conference Core Package Support**

For list of supported MSML Conference Core Package elements, see [MSML Conference Core Package Support](#).

The following pages provide details about the MSML Conference Core Package elements listed below.

- `<asn>`
  controls conference active speaker notification

- `<audiomix>`
  specifies the properties of the conferencing audio mix

- `<clamp>`
  filters tones and/or DTMF digits from an audio stream

- `<createconference>`
  allocates and configures the media mixing resources for conferences

- `<destroyconference>`
  deletes mixers or the entire conference
<gain>
specifies the gain characteristics applied to an audio stream, including the ability to mute and un-mute the stream

<join>
creates one or more streams between two independent objects

<modifyconference>
modifies the properties of an audio mix or the presentation of a video mix of a conference

<modifystream>
modifies properties of an existing stream

<n-loudest>
defines the number of participants that will be included in the conference mix based upon their audio energy

<region>
defines video panes (or tiles) that are used to visually display participants of a video conference

<root>
specifies the root window in which the video mix will be displayed

<selector>
specifies methods and associated parameters for automatic selection and displaying of video within a region or the root window of a conference

<stream>
manipulates and/or specifies properties of specific streams

<unjoin>
removes one or more streams between two independent objects

<var>
specifies the generation of audio using prerecorded audio segments

<videolayout>
specifies the properties of the conferencing video mix
The `<asn>` element is a child of the `<audiomix>` element and may be used when creating or modifying a conference. It enables/disables notification of active speakers. Active speakers are notified using the `<event>` element with an event name of "msml.conf.asn." The namelist of the event consists of the set of active speakers. The name of each item is the string "speaker" with a value of the connection identifier for the connection.

**Note:** The change of going from active speakers to silence will not be reported.

### Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ri</strong></td>
<td>Mandatory. Specifies the minimum reporting interval which defines the minimum duration of time that must pass before changes to active speakers will be reported. A value of zero disables active speaker notification. The minimum reporting interval may be set from 500 ms to 120 seconds. Values may be specified as milliseconds (i.e., 500ms), seconds (i.e., 2s), or minutes (i.e., 2m). Values specified without units will be interpreted as milliseconds. Values specified as milliseconds that are not multiples of 10ms will be rounded up to the nearest 10ms divisible value. Specifying values outside of the supported time interval range for &quot;ri&quot;, or values that are invalid in any other way, such as unsupported units (i.e., 10x), will result in an error response code of 410, invalid attribute value, being returned.</td>
</tr>
</tbody>
</table>

### Events

**msml.conf.asn**

This is the active speaker notification event that will be generated by the media server. An example of an active speaker notification is as follows:

```xml
<event name="msml.conf.asn" id="conf:example">
    <name>speaker</name>
    <value>conn:hd93tg5hdf</value>
    <name>speaker</name>
    <value>conn:w8cn59vei7</value>
    <name>speaker</name>
    <value>conn:p78fhn6sek47fg</value>
</event>.
```

### Shadow Variables

None.

### Examples

The following examples illustrate the usage of the `<asn>` element:

- Creating a basic audio conference with `<asn>` and `<n-loudest>`.
- Modifying a basic audio conference with `<asn>` and `<n-loudest>`.
<audiomix>

**Parent:** `<createconference>`, `<modifyconference>`, `<destroyconference>`

**Child:** `<n-loudest>`, `<asn>`

**Note:** The `<audiomix>` element cannot be destroyed using `<destroyconference>`. Instead the whole conference is destroyed.

**Description**

The `<audiomix>` element specifies the properties of the conferencing audio mix. The properties of the overall audio mix are specified using the `<audiomix>` element and child elements `<n-loudest>` and/or `<asn>`.

**Attributes**

<table>
<thead>
<tr>
<th>Attributes</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>Optional. Specifies the identifier of the audio mix.</td>
</tr>
</tbody>
</table>

**Events**

None.

**Shadow Variables**

None.

**Examples**

The following examples illustrate the usage of the `<audiomix>` element:

- Creating a basic audio conference with `<asn>` and `<n-loudest>`.
- Modifying a basic audio conference with `<asn>` and `<n-loudest>`.

</audiomix>

<clamp>

**Parent:** `<stream>`

**Child Elements:** None.

**Description**

The `<clamp>` element is used to filter tones and/or DTMF digits from an audio stream and is support for audio streams flowing from a network connection object towards a conferencing object.

**Attributes**

<table>
<thead>
<tr>
<th>Attributes</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dtmf</td>
<td>Mandatory: This attribute is used to enable DTMF tone clamping. A value of &quot;true&quot; enables DTMF tone clamping. A value of &quot;false&quot; disables DTMF tone clamping. The default value is &quot;true&quot;.</td>
</tr>
<tr>
<td>tone</td>
<td>Mandatory: This attribute is used to enable tone clamping and is not supported. Must be set to &quot;false&quot;.</td>
</tr>
</tbody>
</table>
**Events**
None.

**Shadow Variables**
None.

**Examples**
None.

<createconference>

**Parent:** <msml>

**Child Elements:** <audiomix>, <videolayout>

**Description**
The `<createconference>` element is used to allocate and configure the media mixing resources for conferences. A description of the properties for each type of media mix required for the conference is defined within the content of the `<createconference>` element. Mixer descriptions are described in Audio Mix and Video Layout sections. When no mixer descriptions are specified, the default behavior is equivalent to inclusion of a single `<audiomix>`.

Clients can request that a media server automatically delete a conference when a specified condition occurs by using the "deletewhen" attribute.

**Attributes**

<table>
<thead>
<tr>
<th>Attributes</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Optional. Specifies the instance name (identifier) of the conference. If the attribute is not present, the media server assigns a globally unique name for the conference. If the attribute is present but the name is already in use, an error (432) will result and MSML document execution will stop. Events that the conference generates will use this name as the value of their &quot;id&quot; attribute.</td>
</tr>
</tbody>
</table>
| deletewhen | Optional. Defines whether a media server should automatically delete the conference. Possible values are "nomedia", "nocontrol", and "never". Default is "nomedia".  
  - A value of "nomedia" indicates that the conference MUST be deleted when no participants remain in the conference. When this occurs, an "msml.conf.nomedia" event notification is sent to the MSML client.  
  - A value of "nocontrol" indicates that the conference MUST be deleted when the SIP dialog that carries the `<createconference>` element is terminated. When this occurs, the media server terminates all conference participant dialogs by sending a BYE for their associated SIP dialog.  
  - A value of "never" leaves the ability to delete a conference under the control of the MSML client. |
### Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
</table>
| **term**  | Optional. Possible values are "true", and "false". Default is "true".  
- A value of "true" indicates that the media server MUST send a BYE request on all SIP dialogs still associated with the conference when the conference is deleted.  
- For a value of "false", SIP dialogs associated with the conference will not be automatically deleted by the media server when the conference is deleted. |
| **mark**  | Optional. A token that MAY be used to identify execution progress in the case of errors. The value of the mark attribute from the last successfully executed MSML element is returned in an error response. Therefore, the value of all mark attributes within an MSML document should be unique. |

### Events

None.

### Shadow Variables

None.

### Examples

The following examples illustrate the usage of the `<createconference>` element:

- Creating a basic audio conference with `<asn>` and `<n-loudest>`.
- Creating a four party layout video conference.
- Single party layout video conference using a `<selector>` element.

### `<destroyconference>`

**Parent:** `<msml>`

**Child Elements:** None.

**Description**

The `<destroyconference>` element is used to delete mixers or to delete the entire conference and all state and shared resources. When a conference is destroyed, SIP dialogs for any remaining participants are maintained or removed based on the value of the "term" attribute when the conference was created. When there is no element content, `<destroyconference>` deletes the entire conference.

**Attributes**

<table>
<thead>
<tr>
<th>Attributes</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>id</strong></td>
<td>Mandatory. This attribute specifies the identifier of the conference to be destroyed or to have mixers removed.</td>
</tr>
<tr>
<td><strong>mark</strong></td>
<td>Optional. A token that MAY be used to identify execution progress in the case of errors. The value of the mark attribute from the last successfully executed MSML element is returned in an error response. Therefore, the value of all mark attributes within an MSML document should be unique.</td>
</tr>
</tbody>
</table>
Events
None.

Shadow Variables
None.

Examples
The following example illustrates the usage of the `<destroyconference>` element:

- Destroying a conference.

`<gain>`

Parent: `<stream>`
Child Elements: None.

Description
The `<gain>` element specifies the gain characteristics applied to an audio stream, including the ability to mute and un-mute the stream. It may be used to adjust the volume of an audio media stream and it may be set to apply a specific gain amount via the "amt' attribute or to automatically adjust the gain to a configured target level via the "agc' attribute. It also provides the ability to mute and un-mute the audio stream also using "amt' attribute.

The `<gain>` element is supported for audio streams flowing between network connection objects and conferencing objects as follows:

- For audio streams flowing from a network connection object towards a conferencing object:
  - Setting: amt="n" (where n is a supported integer value for the amt attribute)
    - Un-mutes the audio stream flowing into the conference, if previously muted, and sets the gain to the specified value.
  - Setting: amt="mute"
    - This mutes the audio stream flowing into the conference.
  - Setting: amt="unmute"
    - Un-mutes the audio stream flowing into the conference.

- For audio streams flowing from a conferencing object towards a network connection object:
  - Setting: amt="mute"
    - This mutes the audio stream flowing out of the conference.
  - Setting: amt="unmute"
    - Un-mutes the audio stream flowing out of the conference.
  - Setting: amt="0"
    - Un-mutes the audio stream flowing out of the conference.
  - Setting: amt= (any other value other than "mute", "unmute", or "0")
    - For this stream, these values for the amt attribute are invalid and not supported.
• For audio streams flowing between two network connection objects:
  o Setting: `amt="n"` (where n is a supported integer value for the `amt` attribute)
    ▪ Sets the gain to the specified value.
  o Setting: `amt="mute"` or `amt="unmute"`.
    ▪ For this stream, these values for the `amt` attribute are invalid and not supported.

### Attributes

<table>
<thead>
<tr>
<th>Attributes</th>
<th>Description</th>
</tr>
</thead>
</table>
| `amt`      | This attribute can be used to specify a gain to apply to the stream. It can also be used to mute or un-mute the stream. Values supported include integers from -32 to 32 representing a gain in dB to apply to the stream. Also supported are the values "mute" and "un-mute".  
  ▪ The `amt` attribute is supported for audio streams flowing from a network connection object towards a conferencing object, for audio streams flowing from a conferencing object towards a network connection object, and for audio streams flowing between two network connection objects. Also see the limitations outlined in the description section for the `<gain>` element. |
| `agc`      | This attribute specifies whether automatic gain control should be enabled or disabled. Supported values are "true" and "false". Default is "false".  
  ▪ The `agc` attribute is supported for audio streams flowing from a network connection object towards a conferencing object. Also see the limitations outlined in the description section for the `<gain>` element. |

### Events

None.

### Shadow Variables

None.

### Examples

The following examples illustrate the usage of the `<gain>` element:

- Muting an audio stream flowing into a conference.
- Un-muting an audio stream flowing into a conference.
<join>

Parent: <msml>

Child Elements: <stream>

Description
The <join> element is used to create one or more streams between two independent objects identified by the id1 and id2 attributes. Streams may be audio or video and may be bidirectional or unidirectional. A bidirectional stream is implicitly composed of two unidirectional streams that can be manipulated independently. The streams to be established are specified by <stream> child elements as the content of <join>.

Without any content, <join> by default establishes a bidirectional audio stream. When only a stream of a single type has previously been created between two objects, or when only a unidirectional stream exists, <join> can be used to add a stream of another media type or make the stream bidirectional by including the necessary <stream> elements. Bidirectional streams are made unidirectional by using <unjoin> to remove the unidirectional stream for the direction that is no longer required.

In addition to defining the media type and direction of streams, <stream> elements are also used to establish the properties of streams, such as gain, voice masking, or tone clamping of audio streams, or labels and other visual characteristics of video streams. Properties are often defined asymmetrically for a single direction of a stream. Creating a bidirectional stream requires two <stream> elements within the <join>, one for each direction, if one direction is to have different properties from the other direction.

Attributes

<table>
<thead>
<tr>
<th>Attributes</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id1</td>
<td>Mandatory. This attribute specifies an identifier of either a connection or conference. Wildcards do not apply for join operations.</td>
</tr>
<tr>
<td>id2</td>
<td>Mandatory. This attribute specifies an identifier of either a connection or conference. Wildcards do not apply for join operations.</td>
</tr>
<tr>
<td>mark</td>
<td>Optional. A token that MAY be used to identify execution progress in the case of errors. The value of the mark attribute from the last successfully executed MSML element is returned in an error response. Therefore, the value of all mark attributes within an MSML document should be unique.</td>
</tr>
</tbody>
</table>

Events

None.

Shadow Variables

None.
Examples

The following examples illustrate the usage of the <join> element:

- Joining preferred party, full-duplex and listen-only parties to an audio conference.
- Call center coach-pupil conference.
- Un-joining streams using wildcards.
- Continuous digit collection on a conference participant.
- Creating a four party layout video conference.
- Expanding a four party layout to a six party layout video conference.
- Single party layout video conference using a <selector> element.
- Sequencing parties through regions in a video conference layout.

<modifyconference>

Parent: <msml>

Child Elements: <audiomix>, <videolayout>

Description

The <modifyconference> element is used to modify the properties of an audio mix or the presentation of a video mix of a conference. All of the properties of an audio mix or the presentation of a video mix may be changed during the life of a conference using the <modifyconference> element. Changes to an audio mix are requested by including an <audiomix> element as a child of <modifyconference>. This may also be used to add an audio mixer to the conference if none was previously allocated.

Changes to a video presentation are requested by including a <videolayout> element as a child of <modifyconference>. Similar to an audio mixer, this may be used to add a video mixer if none was previously allocated. Mixers are removed by including a mixer description element within <destroyconference>.

Features and presentation aspects are enabled/added or modified by including the element(s) that define the feature or presentation aspect within a mixer description. The complete specification of the element must be included just as it would be included when the conference is created. The new definition completely replaces any previous definition that existed. Only things that are defined by elements included in the mixer descriptions are affected. Any existing configuration aspects of a conference, which are not specified within the <modifyconference> element, maintain their current state in the media server.

Attributes

<table>
<thead>
<tr>
<th>Attributes</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>Mandatory. Specifies the identifier of the conference to be modified.</td>
</tr>
<tr>
<td>mark</td>
<td>Optional. A token that MAY be used to identify execution progress in the case of errors. The value of the mark attribute from the last successfully executed MSML element is returned in an error response. Therefore, the value of all mark attributes within an MSML document should be unique.</td>
</tr>
</tbody>
</table>
Events
None.

Shadow Variables
None.

Examples
The following examples illustrate the usage of the `<modifyconference>` element:
- Modifying a basic audio conference with `<asn>` and `<n-loudest>`.
- Expanding a four party layout to a six party layout video conference.
- Contracting a six party layout to a four party layout video conference.
- Layered regions in a video conference.

`<modifystream>`

Parent: `<msml>`

Child Elements: `<stream>`

Description
The `<modifystream>` element is used to modify properties of an existing stream. Media streams can have different properties such as the gain for an audio stream or a visual label for a video stream. These properties are specified as the content of `<stream>` elements. The `<modifystream>` element is used to change the properties of a stream by including one or more `<stream>` elements that are to have their properties changed.

Stream properties are set as specified by the element `<stream>` as a child element of the `<modifystream>` element. Any properties not included in the `<stream>` element when modifying a stream will remain unchanged. Setting a property for only one direction of a bidirectional stream will NOT affect the other direction. The direction of streams can be changed by issuing an `<unjoin>` followed by a `<join>`. Any streams that exist between the two objects that are not included within `<modifystream>` will not be affected.

Attributes

<table>
<thead>
<tr>
<th>Attributes</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ld1</td>
<td>Mandatory. This attribute specifies an identifier of either a connection or conference. Wildcards do not apply for join operations.</td>
</tr>
<tr>
<td>ld2</td>
<td>Mandatory. This attribute specifies an identifier of either a connection or conference. Wildcards do not apply for join operations.</td>
</tr>
<tr>
<td>mark</td>
<td>Optional. A token that MAY be used to identify execution progress in the case of errors. The value of the mark attribute from the last successfully executed MSML element is returned in an error response. Therefore, the value of all mark attributes within an MSML document should be unique.</td>
</tr>
</tbody>
</table>

Events
None.
Shadow Variables
None.

Examples
The following examples illustrate the usage of the <modifystream> element:
- Muting an audio stream flowing into a conference.
- Un-muting an audio stream flowing into a conference.
- Sequencing parties through regions in a video conference layout.

<n-loudest>

Parent: <audiomix>
Child Elements: None.

Description
The <n-loudest> element defines the number of participants that will be included in the conference mix based upon their audio energy. It specifies the maximum number of conference participants that will be summed as part of the audio mix at any time. Participants to be mixed are determined by audio energy levels.

When the <n-loudest> element has not been included when creating, nor when modifying a conference, the maximum number of conference participants that will be summed as part of the audio mix at any time will be equivalent to the default for the media server. This default may be set via configuration options provided for the media server.

Attributes

<table>
<thead>
<tr>
<th>Attributes</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>Mandatory. The attribute &quot;n&quot; specifies the number of participants as mentioned above. Supported values are integers from 2 to 10.</td>
</tr>
</tbody>
</table>

Events
None.

Shadow Variables
None.

Examples
The following examples illustrate the usage of the <n-loudest> element:
- Creating a basic audio conference with <asn> and <n-loudest>.
- Modifying a basic audio conference with <asn> and <n-loudest>. 
The `<region>` element is used to define video panes (or tiles) that are used to display participant video streams in a video conference. Regions are rendered on top of the root window. Up to 10 regions may be defined for each conference.

The location of the top left corner of a region is specified using the position attributes "top" and "left" and is defined relative to the top left corner of the root window. The size of a region is specified using the "relativesize" attribute and is defined relative to the size of the root window.

An example of a video layout with six regions is:

```
+--------+--------+
|        |  2     |
|  1     | +--------+
|        |  3     |
|        | +--------+
|  6     |  5     |  4  |
+--------+--------+
```

```xml
<videolayout type="text/msml-basic-layout">
  <root size="CIF"/>
  <region id="1" left="0" top="0" relativesize="2/3"/>
  <region id="2" left="67%" top="0" relativesize="1/3"/>
  <region id="3" left="67%" top="33%" relativesize="1/3"/>
  <region id="4" left="67%" top="67%" relativesize="1/3"/>
  <region id="5" left="33%" top="67%" relativesize="1/3"/>
  <region id="6" left="0" top="67%" relativesize="1/3"/>
</videolayout>
```

Portions of regions that extend beyond the root window will be cropped.

For example, a layout specified as:

```
<videolayout size="CIF">
  <root size="CIF"/>
  <region id="foo" left="50%" top="50%" relativesize="2/3"/>
</videolayout>
```

would appear similar to:

```
+--------+--------+
|        | root    |
|background|        |
|        | +-----+---|
|        |  | foo  |
|        | +-----+---|
|        | //////|
```

The area of the root window covered by a region is a function of the region's position and its size. When areas of different regions overlap, they are layered in order of their "priority" attribute.
The region with the highest value for the "priority" attribute is below all other regions and will be hidden by overlapping regions. The region with the lowest non-zero value for the "priority" attribute is on top of all other regions and will not be hidden by overlapping regions. The priority attribute may be assigned values between 0 and 1. Note that a value of "0" is currently not supported. According to RFC 5707, a value of "0" disables the region, freeing any resources associated with the region, and unjoining any video stream displayed in the region. Since a value of "0" is not supported, these steps must be done explicitly. A region can be made invisible with the relativesize attribute set to a value of "0" and can be modified using <modifyconference>. The region itself, once create will not be destroyed until a <destroyconference> is invoked. The "priority" attribute set to a value of "0" will also currently make a region invisible but this behavior will be modified in the future when the behavior specified in the RFC for a value of "0" is supported.

Regions that do not specify a priority will be assigned a priority by a media server when a conference is created. The first region within the <videolayout> element that does not specify a priority will be assigned a priority of one, the second a priority of two, etc. In this way, all regions that do not explicitly specify a priority will be underneath all regions that do specify a priority. As well, within those regions that do not specify a priority, they will be layered from top to bottom, in the order they appear within the <videolayout> element.

For example, if a layout was specified as follows:

```xml
<videolayout>
  <root size="CIF"/>
  <region id="a" ... priority=".3" .../>
  <region id="b" ... />
  <region id="c" ... priority=".2" ...>
  <region id="d" ... />
</videolayout>
```

Then the regions would be layered, from top to bottom, c, a, b, d.

### Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>Mandatory. This attribute specifies a name that is used to refer to the region. For example, reference to a region is required when modifying the characteristics of a region and when specifying which region a video stream will be displayed in. Note that once a region is created for a conference, that region will continue to exist for the life of the conference. Therefore only 10 regions with 10 unique ids can be used for regions of a conference. The region can be made invisible and it can be reused with different characteristics. But the region and its id will only be destroyed when the conference that it belongs to is destroyed or the video mix of the conference that it belongs to is destroyed (see &lt;destroyconference&gt;).</td>
</tr>
<tr>
<td>left</td>
<td>This attribute specifies the position of the left edge of the region as a relative offset from the left edge of the root window. Values may be expressed either as a percent (%) or fraction (x/y) of the horizontal dimension of the root window. Supported values, when expressed as a percent, range from 100.00000% to 100.00000%. Supported values, when expressed as a fraction, range from 100.0000/001.0000 to 100.0000/001.0000.</td>
</tr>
</tbody>
</table>
### Attributes

<table>
<thead>
<tr>
<th>Attributes</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>top</td>
<td>This attribute specifies the position of the top edge of the region as a relative offset from the top edge of the root window. Values may be expressed either as a percent (%) or fraction (x/y) of the horizontal dimension of the root window. Supported values, when expressed as a percent, range from 100.0000% to 100.0000%. Supported values, when expressed as a fraction, range from 100.0000/001.0000 to 100.0000/001.0000.</td>
</tr>
</tbody>
</table>
| relativesize | This attribute specifies the size of the region relative to the root window. Since the size is specified relative to the root window, the aspect ratio of the region will be the same as the aspect ratio of the root window. Values may be expressed either as a percent (%) or fraction (x/y) of the root window. Supported values, when expressed as a percent, range from 000.0000% to 100.0000%. Supported values, when expressed as a fraction, range from 0 to 100.0000/001.0000. 
When the attribute relativesize is set to a value of "0", the region will continue to exist but the region will become invisible. |
| priority   | This attribute specifies a priority level determining how regions are visible when they overlap with other regions. Regions with lower priority levels will be layered on top of regions with higher priority levels. Supported values are 0.1 to 0.9 (0.1, 0.2, ..., 0.9). If no value is specified, a priority value of ">1" is assigned dependent upon the order of creation. For regions with the same priority level, the last region created will be layered on top of previous regions created. Note that a value of "0" is currently not supported. |

### Events

None.

### Shadow Variables

None.

### Examples

The following examples illustrate the usage of the `<region>` element:

- Creating a four party layout video conference.
- Expanding a four party layout to a six party layout video conference.
- Contracting a six party layout to a four party layout video conference.
- Layered regions in a video conference.
<root>

Parent: <videolayout>, <selector>

Child Elements: None.

Description
The <root> element describes the root window or virtual screen in which the conference video mix will be displayed. Simple conferences can display participant video directly within the root window but more complex conferences will use regions for this purpose. Areas of the window, for this case, which are not used to display video, will show the root window background.

All video presentations require a root window. It MUST be present when a video mix is created and it cannot be deleted; however, its attributes MAY be changed using the <modifyconference> element.

<tr>
<td>size</td>
<td>This attribute specifies the resolution of the root window. Supported values are: SQCIF, QCIF, CIF, QVGA, VGA, 720p, and 720p_4x3. The attribute is mandatory when creating the conference.</td>
</tr>
</tbody>
</table>

Events
None.

Shadow Variables
None.

Examples
The following examples illustrate the usage of the <root> element:

- Creating a four party layout video conference.
- Expanding a four party layout to a six party layout video conference.
- Contracting a six party layout to a four party layout video conference.
- Layered regions in a video conference.
- Single party layout video conference using a <selector> element.

<selector>

Parent: <videolayout>

Child Elements: <root>

Description
The <selector> element is used to define the selection criteria and its associated parameters when choosing one of several video streams to be automatically selected and displayed. The selection algorithm used to select the video stream is specified by the "method" attribute. Currently, "vas: Voice Activated Switching is the only supported method."
Attributes

<table>
<thead>
<tr>
<th>Attributes</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>Mandatory. This attribute specifies a name that is used to refer to the selector. For example, reference to a selector is required when specifying which selector region (or root) that a video stream will be displayed in.</td>
</tr>
<tr>
<td>method</td>
<td>The name of the method used to select the video stream. Supported values are &quot;vas&quot; (Voice Activated Switching).</td>
</tr>
</tbody>
</table>

Events

Examples

The following example illustrates the usage of the `<selector>` element:

- Single party layout video conference using a `<selector>` element.

<stream>

Parent: `<join>`, `<unjoin>`, `<modifystream>

Child Elements: `<gain>`, `<clamp>`

Description

The `<stream>` element is used to manipulate and/or specify properties of specific individual streams. They may be included as a child element in any of the stream manipulation elements `<join>`, `<modifystream>`, or `<unjoin>`. The type of the stream, audio or video, is specified using a "media" attribute.

A bidirectional stream is identified when no direction attribute "dir" is present. A unidirectional stream is identified when a direction attribute is present. Additional properties via attributes and child elements may be specified as the content of `<stream>` elements when the element is used as a child of `<join>` or `<modifystream>`. Other than specifying "media" and "dir", additional properties via attributes and child elements should not be specified when streams are removed using `<stream>` elements as a child of the `<unjoin>` element.

Attributes

<table>
<thead>
<tr>
<th>Attributes</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>media</td>
<td>Mandatory. Value must be set to &quot;audio&quot; or &quot;video&quot;.</td>
</tr>
<tr>
<td>dir</td>
<td>Optional. Value may be set to &quot;from-id1&quot; or &quot;to-id1&quot;. These values are relative to the identifier attributes of the parent element.</td>
</tr>
</tbody>
</table>
Attributes for audio streams that are inputs to a conference:

The following attributes are <stream> attributes specifically for audio streams that are formed when joining participants to a conference. These attributes MAY be used for an audio stream that is an input to a conference and MUST NOT be used for other streams.

<table>
<thead>
<tr>
<th>Attributes</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>preferred</td>
<td>Optional. Defines if the stream will always be mixed and audible to conference participants or whether it will need to contend for N-loudest mixing.</td>
</tr>
<tr>
<td></td>
<td>• A value of &quot;true&quot; means that the stream will always be mixed when speech is present. This means that party's input, providing its speech level is greater than zero, is always included in the output summation process along with the loudest remaining &quot;Standard/Pupil&quot; parties within the active talker limit defined for the conference.</td>
</tr>
<tr>
<td></td>
<td>• A value of &quot;false&quot; means that the stream MAY contend for mixing into a conference when N-loudest mixing is enabled. Default is &quot;false&quot;.</td>
</tr>
<tr>
<td></td>
<td>• A value of &quot;true_enhanced&quot; means that the stream MUST always be mixed independent of the speech detection algorithm. This setting is better suited for use cases such as providing music or a soundtrack as an input into the conference.</td>
</tr>
<tr>
<td>dlgc:conf_party_type</td>
<td>Optional. This is a Dialogic extension. This attribute specifies a conference party type.</td>
</tr>
<tr>
<td></td>
<td>• A value of &quot;coach&quot; may be specified. Two selected parties can establish a private communication link within the overall conference. The coach is a private member of the conference and is only heard by the pupil. However, the pupil cannot speak privately with the coach.</td>
</tr>
<tr>
<td></td>
<td>• A value of &quot;pupil&quot; may be specified. See &quot;coach&quot; above.</td>
</tr>
<tr>
<td></td>
<td>• A value of &quot;standard&quot; may be specified. Default is &quot;standard&quot;.</td>
</tr>
<tr>
<td>dlgc:echo_cancel</td>
<td>Optional. This is a Dialogic extension. This attribute is used to enable or disable echo cancellation.</td>
</tr>
<tr>
<td></td>
<td>• A value of &quot;disable&quot; may be specified. Default is &quot;disable&quot;.</td>
</tr>
<tr>
<td></td>
<td>• A value of &quot;enable&quot; may be specified.</td>

<tbody>
<tr>
<td>display</td>
<td>Optional. This attribute specifies the identifier of a video layout region or selector that is to be used to display the video stream.</td>
</tr>
</tbody>
</table>

Events

None.
Shadow Variables
None.

Examples
The following examples illustrate the usage of the <stream> element:
- Joining preferred party, full-duplex and listen-only parties to an audio conference.
- Call center coach-pupil conference.
- Setting <stream> attribute for echo cancellation.
- Muting an audio stream flowing into a conference.
- Un-muting an audio stream flowing into a conference.
- Un-joining streams using wildcards.
- Creating a four party layout video conference.
- Expanding a four party layout to a six party layout video conference.
- Single party layout video conference using a <selector> element.
- Sequencing parties through regions in a video conference layout.

<unjoin>

Parent: <msml>

Child Elements: <stream>

Description
The <unjoin> element is used to remove one or more existing media streams flowing between two independent objects identified by the id1 and id2 attributes. The <unjoin> element may also be used to remove streams flowing between a specific object and any other object by using wildcards in one of the identifier attributes.

In the absence of any child elements for the <unjoin> element, all media streams between the objects will be removed. Individual streams may be removed by specifying them using <stream> child elements, while the unspecified streams will not be removed. A bidirectional stream is changed to a unidirectional stream by unjoining the direction that is no longer required, using the <unjoin> element. Operator elements MUST NOT be specified within <stream> elements when streams are being removed using the <unjoin> element. Any specified stream operators included will be ignored.

Attributes

<table>
<thead>
<tr>
<th>Attributes</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id1</td>
<td>Mandatory. This attribute specifies an identifier of either a connection or conference. Wildcards do not apply for join operations.</td>
</tr>
<tr>
<td>id2</td>
<td>Mandatory. This attribute specifies an identifier of either a connection or conference. Wildcards do not apply for join operations.</td>
</tr>
<tr>
<td>mark</td>
<td>Optional. A token that MAY be used to identify execution progress in the case of errors. The value of the mark attribute from the last successfully executed MSML element is returned in an error response. Therefore, the value of all mark attributes within an MSML document should be unique.</td>
</tr>
</tbody>
</table>
Events
None.

Shadow Variables
None.

Examples
The following examples illustrate the usage of the <unjoin> element:

- Un-joining streams using wildcards.
- Contracting a six party layout to a four party layout video conference.

<var>
Parent: <play>
Child Elements: None.

Description
The <var> element specifies the generation of audio using prerecorded audio segments that are selected and dynamically played in sequence based upon a specified variable. The variable may represent such items as date, time, and money.

Stringing together prerecorded selected audio segments allows an application better control of the "sound and feel" of the service provided to end users. It also provides very high audio quality and allows the variables to blend seamlessly with the surrounding audio segments.

Attributes

<table>
<thead>
<tr>
<th>Attributes</th>

</tbody>
</table>
| **value** | The value is always specified as YYYYMDD (per ISO 8601, International Date and Time Notation)  
YYYY: 1900-2999  
MM: 01-12  
DD: 01-31 |
| **subtypes** (mandatory) |  
**mdy** Specifies month, day and year  
Example: 20021015 is spoken as "October Fifteenth Two Thousand Two"  
**dmy** Specifies day, month and year  
Example: 20021015 is spoken as "Fifteen October Two Thousand Two"  
**ymd** Specifies year, month and day  
Example: 20021015 is spoken as "Two Thousand Two October Fifteen" |
| **digits** | The value is spoken as a string of digits, one at a time, in the form specified by the subtype.  
**value** 0-9  
**subtypes** (mandatory)  
**gen** Digits are spoken as generic digits, one at a time (one, five, zero) with no pause  
**ndn** Digits are spoken with North American dialing phone number phrasing (NPA-NXX-XXXX), with appropriate pauses |
| **duration** | Duration is specified in seconds and is spoken in one or more units of time as specified by the subtype.  
**value** 1 - 4,294,967,295 (>136 years)  
**subtypes** (mandatory)  
**yrs** The value is converted and spoken as years, days, hours, minutes, and seconds  
Example: 31626061 is spoken as "one year, one day, one hour, one minute, and one second"  
**hrs** The value is converted and spoken as hours, minutes, and seconds  
Example: 3661 is spoken as "one hour, one minute, and one second"  
**mns** The value is converted and spoken as minutes and seconds  
Example: 3661 is spoken as "sixty one minutes, and one second" |
| **money** | Money is specified in the smallest unit of currency for the indicated subtype. The value is converted and spoken, per the subtype, as large units of currency followed by the remainder in smaller units of currency (for example, dollars and cents).  
**value** 0 - 99999999999 |
<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| usd  | US dollar (cents) - (format: $$¢¢)
Example: 1025 is spoken as "ten dollars and twenty five cents"
| cny  | Chinese yuan (fen) - (format: $$¢¢)
Example: 1255050 is spoken as "one wan, two thousand, five hundred, five shi, dollar, and fifty cents"
| month| The value is spoken as a month and is specified in the MM format, with 01 denoting January, 02 denoting February, 10 denoting October, and so forth.
value| The value is always specified as MM: 01-12
subtypes (optional)
Note: If a subtype is included, the value must be "null".
| number| The value is a number in cardinal or ordinal form as specified by the subtypes.
value| cardinal form: -999999999999999 to 999999999999999
ordinal form: 0 to 999999999999999
subtypes (mandatory)
crd  | cardinal
5111 is spoken as "five thousand, one hundred and eleven"
421 is spoken as "four hundred and twenty one"
ord  | ordinal
5111 is spoken as "five thousand, one hundred and eleventh"
421 is spoken as "four hundred and twenty-first"
| silence| Plays a period of silence.
value| 0 - 36000 (in 100 ms units up to 1 hour)
subtypes (optional)
Note: If a subtype is included, the value must be "null".
| time | The value is spoken as a time of day in either twelve or twenty-four hour HHMM format according to ISO 8601, International Data and Time, as specified by the subtypes.
value| The value is always specified as HHMM (per ISO 8601, International Date and Time Notation)
HH: 00-24 refers to a zero-padded hour, 2400 (HHMM) denotes midnight at the end of the calendar day
MM: 00-59 refers to a minute
subtypes (mandatory)
<table>
<thead>
<tr>

- Playing the prompt for number.
- Playing the prompt for silence.
- Playing the prompt for time.
- Playing the prompt for weekday.
- Playing the prompt for string.

<videolayout>

**Parent:** <createconference>, <modifyconference>

**Child Elements:** <root>, <region>, <selector>

**Description**

A video layout is specified using the `<videolayout>` element. It is used as a container to hold elements that describe all of the properties of a video mix. The parameters of the window that displays the video mix are defined by the `<root>` element. When the video mix in composed of multiple panes, the location and characteristics of the panes are defined by one or more `<region>` elements. A `<region>` element is not required when only a single video stream is displayed at one time and none of the visual attributes of regions are required.

**Attributes**

4. Deviations

Deviations from RFC 5707

The version of the MSML Media Server Software described in this publication is based on RFC 5707.

The following is a list of deviations from RFC 5707:

- Nested groups are not supported.
- Only the "parallel" topology for <group> elements is supported.
- Wildcard IDs for the <modifystream> element are not supported.
- Audio and video can play child elements but they can only be played sequentially. The <audio> and <video> elements must be child elements of the <media> element to play an audio-visual recording.
- The offset attributes of the <play> element have no effect when playing a video.
- When recording an audio-visual item, the audiodest and videodest attributes must be used.
- Audio-visual recordings are currently recorded into two separate files.
- Audio-visual playback is supported via two separate files and must be defined in an <audio> and <video> element.
- The format attribute of the <pattern> element supports the "moml+digits" format only. The "mgcp" and "megaco" formats are not supported.
- In the case of a <record> with a child <play>, the record does not start until the play is complete. Once the record begins, it can be terminated with the requested termkey.
- The <grammar> element fails if xml:lang attribute is not included. The <grammar> element is simply passed through to the speech server. It is the responsibility of the script author to ensure that the SRGS is valid and is processed correctly by the speech server.
- Media Server is ignoring the audiosamplerate and audiosamplesize attributes for a recording.
- When recording video using <record>, all video format parameters must be specified or none should be specified. If none specified, defaults from the stream being recorded will be used. A partial or incomplete format specification will not be accepted.
Differences between Native and Legacy MSML

PowerMedia XMS includes a Native distributed MSML service that leverages all of the technologies available in PowerMedia XMS.

The Native service is the default and recommended MSML service in PowerMedia XMS and replaces the previous legacy MSML service. The previous legacy MSML service is available for backward compatibility.

The following is a list of differences between Native and legacy MSML:

- The legacy MSML cpa (call progress analysis) primitive is not supported. The native MSML supports cpa through the cpa="yes" parameter in the SIP INVITE Request URI, which sends <send target="source" event="cpa" namelist="cpa.detect"/> event.
  
  The cpa.detect values can be:
  
  o "unknown"
  o "answer-machine"
  o "voice"
  o "fax"

- Conference Bridging is not supported.

- A connection (call) can only be joined to one other object at a time (call or conference).

- If a party is joined to a conference, a media file cannot be played privately to the party without first unjoining the party.

- When playing media from a http:// uri, the web server must be configured to return the appropriate MIME type for the media.

- The codecs keyword of the format attribute for media play and record must be specified in the plural exactly as written in RFC 5707. The legacy MSML accepted codec as a substitute for codecs. This is no longer the case. The Native MSML strictly follows RFC 5707.

- The maxtime attribute of the <play> element refers to each media element and not the total time for the play.

- While the error codes from operation failures are the same, some of the descriptive text may have changed.

- DTMF pattern matching now works closer to RFC 5707 specification. Some script adjustments may be required.

- In Native mode, PowerMedia XMS has other active services besides MSML. In order to make sure that the incoming call is routed to the Native MSML service, the sip uri should begin with sip:msml or a route that matches the sip uri user part (which needs to be added to the call routing table in the Console). For more information, see the Routing section of Dialogic® PowerMedia™ XMS Installation and Configuration Guide.
• The MSML Media Server is engineered to take advantage of multi-core systems by processing concurrent calls simultaneously on different cores. When writing MSML scripts that include operations that affect more than one call id or affect a different call id than the id the script is executing on, the target call may be executing on a different processor core with its own independent timing characteristics. For example, when executing a script that joins two calls and a disconnect of one of the calls occurs simultaneously or immediately after the join script is sent to PowerMedia XMS, it is possible for the target call to complete the disconnect before the join can complete, thereby causing the join script to receive an error from PowerMedia XMS indicating that the target of the join does not exist.

• When a MSML <dialogEnd> is received by the media server: The native MSML implementation will respond with a msml.dialog.exit event to the SIP call that created the MSML dialog; The legacy MSML implementation will respond with a msml.dialog.exit event to the SIP call that sent the MSML <dialogEnd>.
5. Feature Details

This chapter describes the features supported by the current version of the MSML Media Server Software in detail and provides information on how to use these features. Topics include:

- Media Stream Direction Support
- HTTPS Play and Record
- Session File Transfer
- Pattern Matching with \(<\text{dtmf}>/\text{<collect}>\)
- Monitoring RTP Timeout Alarms
- Multiple URI for \(<\text{audio}>\) and \(<\text{video}>\)

**Note:** A feature may not be supported on all platforms. For more information, see High-Level Feature Summary in Feature and Protocol Package Support.

**Media Stream Direction Support**

This feature supports both full-duplex and half-duplex media streams. The direction of the media stream is based on the direction attribute supplied in the Session Description Protocol (SDP) using one of the following direction attributes, "sendrecv", "sendonly", or "recvonly".

- If no direction attribute is supplied and a valid connection address "c=" is supplied, a full duplex media stream is established.
- If a connection address "c=" is set to 0.0.0.0, then a half duplex receive only media stream is established.
- The re-INVITE is rejected if the connection address "c=" is set to 0.0.0.0 and the direction attribute is "sendrecv" or "recvonly", or if the direction attribute is set to "inactive".

Support is provided for receiving an initial inbound INVITE with or without a valid SDP. In the case where the INVITE received does not contain an SDP, the media server (MS) will respond with an SDP offer in the 200 OK. The media flow direction is based on the answer SDP. When the inbound INVITE contains an SDP, the MS will respond with a valid SDP answer in the 200 OK and the media flow direction will be based on the offer SDP.

When an initial inbound INVITE is received with a valid SDP with a connection address "c=" value of 0.0.0.0, the MS responds with a valid SDP answer in the 200 OK. Media flow will be started as receive only.

A re-INVITE can be received any time after the call is established. Multiple re-INVITE requests can be received on the same SIP session, but prior requests must be processed and responded to before a new request can be received.

The media stream remains active based on the previous media stream capabilities and direction. A re-INVITE request with an invalid SDP will be rejected, but this has no effect on the current media stream. The answer or offer SDP contains a valid connection address "c=". If the connection address "c=" equals 0.0.0.0 and no direction attribute is set, then a direction attribute of "sendonly" is assumed. If a direction attribute other than "sendonly" is set, the re-INVITE is rejected. The answer or offer SDP direction attribute cannot be set to "inactive".
**HTTPS Play and Record**

The application server has the ability to store media recordings directly to an HTTPS server. The application server can also play a recording and/or retrieve MSML dialog source directly from an HTTPS server.

**Feature Description**

HTTPS support enables the retrieval of MSML scripts directly from a web server for execution. It also allows the storage and retrieval of audio and video recordings to and from the HTTPS server.

**Requirements for HTTPS Support**

The MSML Media Server Software uses the HTTPS GET and HTTPS PUT commands to retrieve and store files respectively. When using MSML attributes that specify the "https://" scheme, it is important that the HTTPS server support the HTTPS GET and HTTPS PUT commands. Typically, HTTPS servers support the HTTPS GET command, but when receiving HTTPS PUT commands, some servers require server-side scripts to actually store files.

**Dialog Execution**

An external MSML dialog/script can be retrieved and executed from an HTTPS server. Dialogs are a class of objects that represent automated participants. Dialogs are created and destroyed through MSML.

The "https://" scheme for the src attribute of an MSML <dialogstart> is supported. MSML dialog execution commences after the entire MSML body has been retrieved from the HTTPS server. The HTTPS GET functionality is used to retrieve the information from the web server.

**Audio and Video Playback**

Both audio and video files are retrievable from the HTTPS server.

If an audio file is being played in conjunction with a video file, playback will not start until the entire audio and video files are downloaded. The "https://" scheme is supported in the uri attribute of the MSML <audio> and <video> elements. The uri attribute identifies the location of the audio or video file. The HTTPS GET functionality will be used to retrieve the information from the web server. Currently, only the Dialogic proprietary video format is supported.

**Audio and Video Recording**

MSML supports storing audio and video files to an HTTPS server. Both are stored locally and uploaded to the HTTPS server immediately after the recording has completed.

New audio files are stored in the location identified in the "https://" scheme for the dest attribute of the MSML <record> element. The audio portion of an audio / video recording is stored in the location specified at "https://" scheme for the audiodest attribute, while the location of the new video file is stored in the location identified at "https://" scheme for the videodest attribute of the MSML <record> element. The HTTPS PUT functionality is used to send the information to the web server.
Session File Transfer

The `<transfer>` element is a proprietary Dialogic extension of RFC 5707 that supports transferring objects referenced by a source URI to a destination URI, including transferring file objects over HTTP and MSRP.

<transfer>

Parent: None.

Child Elements: `<fileobj>`, `<transferstart>`, `<transferobjstart>`, `<transferobjdone>`, `<transferexit>`

Description

The `<transfer>` element transfers objects defined by the child elements.

Transfer supports two states: transmit and suspend. Media transmission occurs in the transmit state and is suspended in the suspend state. The default initial state is transmit.

Attributes

<table>
<thead>
<tr>
<th>Attributes</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>An optional identifier that may be referenced elsewhere for sending events to the <code>&lt;transfer&gt;</code> element.</td>
</tr>
<tr>
<td>ftt</td>
<td>Defines the first transmit timer value. The first transmit timer is started when the transfer element is initially invoked or when the starttimer event is received. If the first transfer object completion has not been detected during this initial interval, the shadow variables are set and the dialog exits. Optional, default is 0s (wait forever for the first transfer object to complete).</td>
</tr>
<tr>
<td>itt</td>
<td>Defines the inter transmit timer. When specified, the timer is started when a transfer object completes. If a subsequent transfer object completion has not been detected when this timer expires, the shadow variables are set and the dialog exits. Optional, default is 0s (wait forever for the transfer object to complete).</td>
</tr>
<tr>
<td>mtt</td>
<td>Defines the maximum transmit timer. When specified, the timer is started when the transfer element processing begins. If the entire transfer operation completion has not been detected when this timer expires, the shadow variables are set and the dialog exits.</td>
</tr>
<tr>
<td>starttimer</td>
<td>Boolean value that defines whether the first transmit timer (ftt) is started initially. When set to false, the starttimer event must be received for it to start. Default is false.</td>
</tr>
<tr>
<td>retry</td>
<td>Specifies the number of times the transfer object elements execution may be retried upon failure, unless those elements specify differently. The value &quot;forever&quot; may be used to indicate that these may be retried any number of times. Default is 0.</td>
</tr>
<tr>
<td>iterate</td>
<td>Specifies the number of times the transfer object elements may be executed unless those elements specify differently. The value &quot;forever&quot; may be used to indicate that these may be executed any number of times. Default is 1.</td>
</tr>
<tr>
<td>initial</td>
<td>Defines the initial state for the transfer element. Default is &quot;transmit&quot;.</td>
</tr>
</tbody>
</table>
Events
The following describes input events to the <transfer> element.

starttimer: starts the first transfer timer (ftt) if it has not already been started. Has no effect otherwise.

terminate: terminates the file transfer and assigns values to the shadow variables. When the destination is file:// and the file transfer is interrupted, the local partial file will be automatically deleted.

resume: causes the transfer to enter transmit state.

Shadow Variables

transfer.duration: the cumulative duration of the individual transfer objects operation expressed as a duration in milliseconds.

transfer.end: contains the event that caused the transfer to stop. When the transfer stops because the objects have been completely transferred, end is assigned the value "transfer.complete". When the transfer stops due to timer expiration, transfer.end will be assigned one of the following: transfer.failed.ftt, transfer.complete.itt, or transfer.complete.maxtime.

Examples
The following examples illustrate the usage of the <transfer> element:

- PUT a file.
- Local file delete.
- Local file copy.
- Transfer file over MSRP and delete it (example in SIP INFO payload with content id).

<fileobj>

Parent: <transfer>

Child Elements: None.

Description
Defines one or more files to transfer from a source to a destination. The <fileobj> objects are processed sequentially. Subsequent <fileobj> may refer to products of previous <fileobj>. For example, the first <fileobj> appends file A to file B and the next <fileobj> transfers file B over MSRP to a file server.

Attributes

<table>
<thead>
<tr>
<th>Attributes</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>objid</td>
<td>An optional object id used in &lt;transferobjdone&gt; events if requested.</td>
</tr>
<tr>
<td>src</td>
<td>A whitespace separated list of uri to be transferred to the destination. Supported schemes include: file:// and xmsrp://. Transferring multiple source uri to a single destination uri is context dependent. If the destination uri refers to a session based protocol such as MSRP, all specified files will be transferred within the same signaling session.</td>
</tr>
<tr>

<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-------------</td>
</tr>
<tr>
<td>dest</td>
<td>The uri of the destination file. Supported schemes include: file:// and xmsrp://.</td>
</tr>
<tr>
<td>contenttype</td>
<td>Mandatory. The MIME type of the content being transferred.</td>
</tr>
<tr>
<td>retry</td>
<td>The number of attempts to transfer the file before reporting an error.</td>
</tr>
<tr>
<td>iterate</td>
<td>The number of times to execute the file transfer.</td>
</tr>
<tr>
<td>delete</td>
<td>When set to true, will delete the file(s) referenced in the src after a successful transmission. The delete attribute is only supported for the file:// uri scheme. Default: false. A simple file delete operation (without an actual transfer) can be accomplished by setting the delete attribute to true and omitting a destination uri.</td>
</tr>
<tr>
<td>append</td>
<td>When set to true, the source file(s) will be appended to the destination file if it exists. If the destination file does not exist, it will be created. The append operation is supported for audio media with file:// scheme URIs only. The source and destination files must have matching containers and media encoding. Default is false.</td>
</tr>
<tr>
<td>overwrite</td>
<td>When set to false, the file:// destination will not be overwritten if it exists. The overwrite attribute is ignored if the destination scheme is not file://. Default is true.</td>
</tr>
</tbody>
</table>

**Events**

MSRP File Transfer URI scheme (xmsrp://)
The PowerMedia XMS specific xmsrp:// uri scheme is used in conjunction with the <transfer> element to specify the MSRP specific parameters that are required to transfer an object using the MSRP protocol. The xmsrp:// uri scheme has the following general format:

```
xmsrp://?offerer=sip_uri;answerer=sip_uri;file=filename;sigcontent=uri;sigheaders=uri
```

The xmsrp:// uri parameters are defined as follows:

- **offerer**: The SIP uri of the offerer (local) endpoint.
- **answerer**: The SIP uri of the answerer (remote) endpoint.
- **file**: The path/filename of the file in the remote file system. If not supplied, or if specifying more than one file in the <fileobj> src, the filename from the source uri will be used.
- **sigcontent**: A cid: scheme uri (RFC 2392) that references content from the multipart/related body part (RFC 2387) that was received in the same INFO message as the MSML script itself. The referenced content will be attached as a body part to the SIP INVITE that will be used to set up the MSRP session for the transfer of the file uri(s) specified in the source attribute.
- **sigheaders**: A cid: scheme uri (RFC 2392) that references content from the multipart/related body part (RFC 2387) that was received in the same INFO message as the MSML script itself. The referenced content is expected to be a list of SIP headers and their values in the standard format:
  - Header-NameA: header value
  - Header-NameB: header value
- Alternatively, a relative file:// uri can be specified that references a file on the PowerMedia XMS node. The file is relative to /etc/xms/msml. For example, file://headers.txt references /etc/xms/msml/headers.txt on the PowerMedia XMS node.

If the xmsrp:// uri is given as the source, the file is transferred from the answerer (remote) to the offerer (local) endpoint. If the xmsrp:// uri is given as the destination, the file is transferred from the offerer (local) to the answerer (remote) endpoint.
Pattern Matching with <dtmf>/<collect>

DTMF input fulfills several roles within MSML dialogs. It is used to trigger events that will affect the media processing operation of other primitives. It is also used to collect DTMF digits from the media stream to be reported back to the source of the MSML dialog.

The following sections detail the supported pattern types and the general pattern matching rules:

**Note:** The reader should be familiar with the nominal reference specification RFC 5707 sections that describe <dtmf> and <pattern> elements.

### Supported Patterns

The following pattern types are supported in PowerMedia XMS MSML:

- **Exact:** digits="123" The incoming digits must exactly match the pattern digits.
- **Wildcard:** digits="1x3" where "x" is the wildcard symbol representing any digit.
- **Length:** digits="length=3;cancel=*" exactly 3 digits must be entered or * cancels the <dtmf> and a dtmf.nomatch.cancel event is generated.
- **MinMax:** digits="min=1;max=3;rtk=#;cancel=*" between 1 and 3 digits must be entered followed by the rtk input termination digit #, * cancels the <dtmf> and a dtmf.nomatch.cancel event is generated. The default for min is 1 and for max is 50. At least one of min, max, rtk, or cancel must be specified.

### Pattern Matching and Digit Buffer Rules

The following specifies the behavior for <dtmf>/<collect>/<pattern> elements:

- There is only one digit buffer per call shared by all primitives (<dtmf>/<collect>/<play>).
- The buffer is reset either during the call setup or through the cleardb attribute of <dtmf>/<collect>/<play>. The cleardb attribute defaults to false for <play> and true for <dtmf>.
- Each cleardb encountered resets the digit buffer; both in sequential and parallel (i.e., group topology) execution.
- A pattern can be in one of three states:
  - Non-matching: The initial state of a pattern.
  - Partially matching: At least one of the match conditions of the pattern is satisfied. For example, one or more (but not all) digits of a pattern match.
  - Matched: All match conditions of the pattern have been satisfied.
- The iterate attribute of the pattern, noinput, and nomatch elements specifies the number of times the element may be executed. An element is executed when its match conditions are satisfied and not necessarily by digit arrival. For example if using edt and rtk, all digits may match but the <pattern> is not executed until edt expires or the rtk digit is entered.
- Each pattern is independent and is comparing digits continuously as they arrive, staying in either the non-matching, partially matching, or matched state.
- If a pattern is in a partially matching state and a non-matching digit arrives, the pattern is reset to non-matching state and the non-matching digit is no longer considered for further matching of that pattern. After the pattern is reset, it resumes matching subsequent digits.
• The idt timer is stopped when a match or nomatch occurs. If iterate is greater than 1 and idt is being used, idt restarts when the next digit arrives.

• If a MinMax pattern with rtk is being used with the edt timer and when the minimum digit condition is satisfied, the following is true:
  o The edt timer is started. Each successive digit will restart the edt timer until the maximum number of digits is collected.
  o If the rtk digit arrives before edt expiry, the pattern transitions immediately to the matched state and rtk digit is included in the dtmf.digits shadow variable.
  o The arrival of a digit other than the rtk digit or the edt expiry will cause the pattern to transition to the non-matching state. The digit buffer (including the non-matching digit if any) is returned in the dtmf.digits shadow variable.

• The terminating conditions of <dtmf>/<collect> are:
  o The corresponding iterate count of pattern, noinput or nomatch elements reaches zero.
  o The idt expires.
  o The arrival of the cancel digit.

Monitoring RTP Timeout Alarms
RTP and RTCP timeout alarms can be monitored by enabling the parameters on the **MSML Advanced Configuration** page from the Console. For more information on how to configure, see the *Dialogic® PowerMedia™ XMS Installation and Configuration Guide*.

When the RTP and RTCP timeout alarms are enabled, PowerMedia XMS MSML will asynchronously send the following MSML event to the application server:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<msml version="1.1">
  <event name="alarm" id="conn:f11a5ac0-36f6a8c0-13c4-50022-64f-20cbb5db-64f">
    <name>alarm.rtp.timeout.state</name><value>on</value>
  </event>
</msml>
```

The supported alarm names are:

• alarm.rtp.timeout.state
• alarm.rtcp.timeout.state

The possible values are:

• on
• off

Multiple URI for <audio> and <video>

In order to minimize delays between multiple <audio> or <video> prompts, the uri attribute for <audio> and <video> elements can be used with multiple uri separated by space. The uri attribute identifies the location of the audio or video file.

The following example shows the format:

```xml
<audio uri="uri1 uri2 uri3">
```

The supplied file uri will be played sequentially with lower latency than if specified using multiple <audio> elements each with one uri.
6. Sample Use Case

This chapter describes a simple application that demonstrates many of the capabilities provided by the current version of the MSML Media Server Software. Topics include:

- Use Case Description
- MSML Control Syntax in Use Case

Use Case Description

In this application, the user is presented with options to play and record audio and video clips/messages. The application server (AS) communicates with the media server (MS) using the MSML Media Server Software to perform the selected operations. Figure 2 shows the exchange of SIP messages between the SIP client, AS, and MS to perform the functionality required. Many of the messages exchanged between the AS and MS include MSML control syntax that are interpreted and acted upon by the MSML Media Server Software.

The following sequence describes the high-level activities from the SIP client and MS perspectives:

1. The SIP client initiates a SIP dialog with the AS and a media session with the MS.
2. The MS plays the Main Prompt with options for the playing of prerecorded clips of News, Weather, Messages, Image of Your Daily Schedule, or the recording of an audio-visual message. The MS then waits on DTMF detection. The MS waits forever and never disconnects, unless a BYE is issued or unless AS timers set a limit on call length.
3. The SIP client makes a selection using DTMF. The selection is to display the Video Portal Prompt.
4. The MS plays the Video Portal Prompt.
5. The SIP client makes a selection using DTMF. The selection is to play a video.
6. The MS plays the selected video clip to completion.
7. The MS plays the Main Prompt.
8. The SIP client makes a selection using DTMF. The selection is to record, then play back, a video message.
9. The MS records the video message.
10. The SIP client stops the recording of the video message with any DTMF.
11. The MS starts the playback of the recorded video message (executed in MSML syntax).
12. The MS plays the recorded video message to completion.
13. The MS plays the Main Prompt.
14. The SIP client disconnects.
15. The MS disconnects.
Figure 2. Audio/Video Play/Record Scenario

1. Establish Connections
   - INVITE
   - 100 Trying
   - 180 Ringing
   - 200 OK
   - ACK
   - RTP Established
   - INFO (Main Prompt Dialog Start)
   - INFO (Main Prompt Dialog End)
   - 200 OK (Main Prompt)

2. Play Main Prompt
   - INFO (DTMF Detect Event)
   - INFO (Video Portal Dialog Start)
   - INFO (Video Portal Dialog End)
   - 200 OK (Portal Prompt)

3. Play Video Portal Prompt
   - INFO (DTMF Detect Event)
   - INFO (Video Clip Start)
   - INFO (Video Clip Dialog Start)
   - 200 OK (Video Clip)
   - INFO (Video Clip Dialog End)
   - INFO (Main Prompt Dialog Start)
   - INFO (Main Prompt Dialog End)
   - 200 OK (Main Prompt)

4. Play Video Clip
   - INFO (Main Prompt Dialog Start)
   - INFO (Main Prompt Dialog End)
   - 200 OK (Main Prompt)

5. Record Message
   - INFO (DTMF Detect Event)
   - INFO (Main Prompt Dialog Start)
   - INFO (Main Prompt Dialog End)
   - 200 OK (Main Prompt)
   - 200 OK (Record Message)
   - 200 OK (Wait for I-frame)

6. Replay Main Prompt
   - (**** MSML control syntax automatically begins playback ****)
   - INFO (Message Dialog Start)
   - 200 OK (Message Dialog End)
   - INFO (Main Prompt Dialog Start)
   - 200 OK (Main Prompt)

7. Terminate Connections
   - BYE
   - 200 OK
MSML Control Syntax in Use Case

Figure 2 includes labels to identify the SIP messages exchanged among the SIP client, AS, and MS. For easier reference, the main steps are designated with numbers and subordinate steps are designated with lowercase letters. The following sections describe the steps (and subordinate steps) with particular emphasis on the MSML control syntax included in the exchanged messages. The main steps are:

- Establish Connections
- Play Main Prompt
- Play Video Portal Prompt
- Play Video Clip
- Record Message
- Replay Main Prompt
- Terminate Connections

Note: In the subsections following, the first SIP INFO message (in Play Main Prompt) is shown in its entirety to highlight the fact that the AS must set the "Content-Type" and "Content-Length" in the SIP header. For the remaining SIP messages, the SIP headers are not included since the focus is on the MSML control syntax.

Establish Connections

Steps 1a to 1i
These steps comprise standard SIP message exchange for the establishment of SIP dialogs between the SIP client and AS and between AS and MS and the establishment of a media session (RTP) between the SIP client and MS. It is over the RTP connection that the user responds to prompts using DTMF selections. There is no MSML control syntax involved in this message exchange.

However, one important piece of information received by the AS in Step 1f is the network connection identifier that is assigned by the MS. The identifier is the "tag" value included in the "To" header of the SIP 200 OK response to the initial INVITE sent by the AS. The following example shows the "To" header.

To: <sip:1.1.1.12>;tag=b19d82a0-0-13c4-13cbd2-58c3964e-13cbd2

In MSML control syntax, the connection identifier is specified as "conn:<tag value>". In the sample control syntax in Play Main Prompt to Replay Main Prompt, the network connection identifier is shown in bold text.

Play Main Prompt

Step 2a
The AS sends the MS an INFO message to play the Main Prompt dialog. The complete INFO message shown below includes MSML control syntax.

```
INFO sip:AS@1.1.1.40:5060 SIP/2.0
Call-ID: ae11d01e-7350-462d-8a9e-169c79d7361a01.1.1.20
From: "Administrator" <sip:WINDOWS-E6UOEQY>;tag=1179327240.1.bababamaggmjjhbgpgjfogkj
To: <sip:1.1.1.12>;tag=b19d82a0-0-13c4-13cbd2-58c3964e-13cbd2
CSeq: 3 INFO
Contact: sip:1.1.1.12:5060
Content-Type: text/xml;charset=UTF-8
Content-Length:709
Max-Forwards: 70
Via: SIP/2.0/UDP 1.1.1.12:5070;branch=z9hG4bK0101010CBADF00D00000109F178B4485
```
Step 2b
The MS sends a 200 OK response to indicate success. The 200 OK response includes the following MSML control syntax.

```xml
<msml version="1.1">
  <result response="200"/>
  <dialogid>conn:b19d82a0-0-13c4-13cbd2-58c3964e-13cbd2 /dialog:10</dialogid>
</msml>
```

Play Video Portal Prompt

Step 3a
At this point, the SIP client makes a selection that is transmitted as DTMF to the MS. The selection is to display the Video Portal Prompt dialog. The MS sends the AS an INFO message that includes the following MSML control syntax describing the DTMF Detect event.

```xml
<msml version="1.1">
  <event name="done" id="conn:b19d82a0-0-13c4-13cbd2-58c3964e-13cbd2 /dialog:10">
    <name>dtmf.digits</name><value>1</value>
  </event>
</msml>
```

Step 3b
The AS sends a 200 OK response to the MS to acknowledge successful receipt of the DTMF Detect event. The 200 OK response does not includes any MSML control syntax.

Step 3c
The MS sends the AS an INFO message with the following MSML control syntax to indicate that the Main Prompt dialog is exiting.

```xml
<msml version="1.1">
  <event name="msml.dialog.exit" id="conn:b19d82a0-0-13c4-13cbd2-58c3964e-13cbd2 /dialog:10"/>
</msml>
```

Step 3d
The AS sends a 200 OK response to the MS to acknowledge Main Prompt dialog exit. The 200 OK response does not contain any MSML control syntax.
**Step 3e**

The AS sends the MS an INFO message to start playing the *Video Portal Prompt* dialog. The INFO message includes the following MSML control syntax.

```xml
<?xml version="1.0" encoding="UTF-8" ?>
<msml version="1.1">
  <dialogstart target="conn:b19d82a0-0-13c4-13cbd2-58c3964e-13cbd2" type="application/moml+xml">
    <group topology="parallel">
      <play>
        <media>
          <video uri="file://./av/vportal_menu.vid" format="video/raw:codecs=h263"/>
          <audio uri="file://./av/vportal_menu.pcm" format="audio/pcm:codecs=mulaw" audiosamplesize="8" audiosamplerate="8"/>
        </media>
      </play>
      <collect iterate="forever" cleardb="true">
        <detect>
          <send target="source" event="done" namelist="dtmf.digits dtmf.len dtmf.end dtmf.last"/>
          <send target="group" event="terminate"/>
        </detect>
      </collect>
    </group>
  </dialogstart>
</msml>
```

**Step 3f**

The MS sends a 200 OK response to the AS to acknowledge the starting of the *Video Portal Prompt* dialog. The 200 OK response includes the following MSML control syntax.

```xml
<msml version="1.1">
  <result response="200"/>
  <dialogid>conn:b19d82a0-0-13c4-13cbd2-58c3964e-13cbd2/dialog:13</dialogid>
</msml>
```

**Play Video Clip**

**Step 4a**

At this point, the SIP client makes a selection that is transmitted as DTMF to the MS. The selection is to play a *Video Clip*. The MS sends the AS an INFO message that includes the following MSML control syntax describing the DTMF Detect event.

```xml
<msml version="1.1">
  <event name="done"
    id="conn:b19d82a0-0-13c4-13cbd2-58c3964e-13cbd2 /dialog:13">
    <name>dtmf.digits</name><value>2</value>
    <name>dtmf.end</name><value>dtmf.detect</value>
    <name>dtmf.last</name><value>2</value>
    <name>dtmf.len</name><value>1</value>
  </event>
</msml>
```

**Step 4b**

The AS sends a 200 OK response to the MS to acknowledge successful receipt of the DTMF Detect event. The 200 OK response does not includes any MSML control syntax.
**Step 4c**
The MS sends the AS an INFO message with the following MSML control syntax to indicate that the Video Portal Prompt dialog is exiting (a response to the DTMF Detect event).

```xml
<msml version="1.1">
  <event name="msml.dialog.exit"
    id="conn:b19d82a0-0-13c4-13cbd2-58c3964e-13cbd2 /dialog:13"/>
</msml>
```

**Step 4d**
The AS sends a 200 OK response to the MS to acknowledge Video Portal Prompt dialog exit. The 200 OK response does not contain any MSML control syntax.

**Step 4e**
The AS sends the MS an INFO message that includes the following MSML control syntax to start the Video Clip (a response to the DTMF Detect event).

```xml
<?xml version="1.0" encoding="UTF-8" ?>
<msml version="1.1">
  <dialogstart target="conn:b19d82a0-0-13c4-13cbd2-58c3964e-13cbd2" type="application/moml+xml">
    <play>
      <media>
        <video uri="file:///av/clip2.vid" format="video/raw:codecs=h263" />
        <audio uri="file:///av/clip2.pcm" format="audio/pcm:codecs=mulaw" audiosamplesize="8" audiosamplerate="8" />
      </media>
    </play>
  </dialogstart>
</msml>
```

**Step 4f**
The MS sends a 200 OK response to the AS to acknowledge the starting of the Video Clip. The 200 OK response includes the following MSML control syntax:

```xml
<msml version="1.1">
  <result response="200"/>
  <dialogid>conn:b19d82a0-0-13c4-13cbd2-58c3964e-13cbd2 /dialog:28</dialogid>
</msml>
```

**Step 4g**
The MS sends the AS an INFO message with the following MSML control syntax to indicate that the Video Clip dialog is exiting (a response to the DTMF Detect event).

```xml
<msml version="1.1">
  <event name="msml.dialog.exit"
    id="conn:b19d82a0-0-13c4-13cbd2-58c3964e-13cbd2 /dialog:28"/>
</msml>
```

**Step 4h**
The AS sends a 200 OK response to the MS to acknowledge Video Clip dialog exit. The 200 OK response does not contain any MSML control syntax.

**Step 4i**
The AS sends the MS an INFO message to play the Main Prompt dialog. The INFO message includes the following MSML control syntax.

```xml
<?xml version="1.0" encoding="UTF-8" ?>
<msml version="1.1">
  <dialogstart target="conn:b19d82a0-0-13c4-13cbd2-58c3964e-13cbd2" type="application/moml+xml">
    <group topology="parallel" >
      <play>
        <media>
```
Step 4j
The MS sends a 200 OK response to indicate success. The 200 OK response includes the following MSML control syntax.

```
<msml version="1.1">
  <result response="200"/>
  <dialogid>conn:b19d82a0-0-13c4-13cbd2-58c3964e-13cbd2 /dialog:8</dialogid>
</msml>
```

Record Message

Step 5a
At this point, the SIP client makes a selection that is transmitted as DTMF to the MS. The selection is to *Record Message*. The MS sends the AS an INFO message that includes the following MSML control syntax describing the DTMF Detect event.

```
<msml version="1.1">
  <event name="done" id="conn:b19d82a0-0-13c4-13cbd2-58c3964e-13cbd2/dialog:8">
    <name>dtmf.digits</name><value>2</value>
  </event>
</msml>
```

Step 5b
The AS sends a 200 OK response to the MS to acknowledge successful receipt of the DTMF Detect event. The 200 OK response does not include any MSML control syntax.

Step 5c
The MS sends the AS an INFO message with the following MSML control syntax to indicate that the *Main Prompt* dialog is exiting (a response to the DTMF Detect event).

```
<msml version="1.1">
  <event name="msml.dialog.exit" id="conn:b19d82a0-0-13c4-13cbd2-58c3964e-13cbd2/dialog:8"/>
</msml>
```

Step 5d
The AS sends a 200 OK response to the MS to acknowledge *Main Prompt* dialog exit. The 200 OK response does not contain any MSML control syntax.
**Step 5e**

The AS sends the MS an INFO message that includes the following MSML control syntax to start the *Record Message* dialog (a response to the DTMF Detect event).

```xml
<?xml version="1.0" encoding="UTF-8"?>
<msml version="1.1">
  <dialogstart target="conn:b19d82a0-0-13c4-13cbd2-58c3964e-13cbd2"
    type="application/moml+xml">
    <group topology="parallel">
      <record beep="true" audiodest="file://./mytest.pcm"
        videodest="file://./mytest.vid" format="video/raw;codecs=mulaw,h263"
        audiosamplerate="8" audiosamplesize="8">
        <recordexit>
          <send target="play" event="resume"/>
        </recordexit>
        <recordexit>
          <send target="record" event="terminate"/>
        </recordexit>
      </record>
      <play initial="suspend">
        <media>
          <audio uri="file://./mytest.pcm" format="audio/pcm;codecs=mulaw"
            audiosamplerate="8" audiosamplesize="8"/>
          <video uri="file://./mytest.vid" format="video/vid;codecs=h263"/>
        </media>
        <playexit>
          <send target="dtmf" event="terminate"/>
          <send target="record" event="terminate"/>
        </playexit>
      </play>
      <dtmf iterate="forever">
        <detect>
          <send target="record" event="terminate"/>
        </detect>
      </dtmf>
    </group>
  </dialogstart>
</msml>
```

**Step 5f**

The MS sends a 200 OK response to the AS to acknowledge the starting of the *Record Message* dialog. The 200 OK response includes the following MSML control syntax.

```xml
<msml version="1.1">
  <result response="200"/>
  <dialogid>conn:b19d82a0-0-13c4-13cbd2-58c3964e-13cbd2/dialog:30</dialogid>
</msml>
```

**Step 5g**

Once the MS is ready to record, it sends the AS an INFO message with the following MSML control syntax to indicate that the MS is waiting for an I-frame. The AS must forward this message to the remote SIP client.

```xml
<?xml version="1.0" encoding="utf-8" ?>
<media_control><vc_primitive><to_encoder><picture_fast_update></picture_fast_update></to_encoder></vc_primitive></media_control>
```

Recording starts once an I-frame is received.

If the MS does not get an I-frame within 5 seconds, another message with the same syntax is sent to the AS indicating that an I-frame timeout occurred. The AS must also forward this message to the remote SIP client. The MS will start recording without a valid I-frame.

**Note:** The FF and RW will move to the nearest I-frame in the file. The effect of jumping to the nearest I-frame means that the FF and RW may not skip by the desired amount. For example, if you FF 3 seconds but the nearest I-frame is 20 seconds, it will FF 20 seconds instead.
Replay Main Prompt

Step 6a
At this point, when the SIP client sends any DTMF to the MS, the recording operation stops and playback begins automatically (as determined by the MSML control syntax in Step 5e). The MS also sends the AS an INFO message that includes the following MSML control syntax indicating a Record Message dialog exit event.

```xml
<msml version="1.1">
  <event name="msml.dialog.exit" id="conn:b19d82a0-0-13c4-13cbd2-58c3964e-13cbd2/dialog:30"/>
</msml>
```

Step 6b
The AS sends a 200 OK response to the MS to acknowledge successful receipt of the event. The 200 OK response does not include any MSML control syntax.

Step 6c
When the playback of the recorded message is complete, the AS sends the MS an INFO message to play the Main Prompt dialog. The INFO message includes the following MSML control syntax.

```xml
<?xml version="1.0" encoding="UTF-8" ?><msml version="1.1">
  <dialogstart target="conn:b19d82a0-0-13c4-13cbd2-58c3964e-13cbd2" type="application/moml+xml">
    <group topology="parallel">
      <play>
        <media>
          <video uri="file://./av/main_menu.vid" format="video/raw:codecs=h263" />
          <audio uri="file://./av/main_menu.pcm" format="audio/pcm:codecs=mulaw" audiosamplesize="8" audiosamplerate="8"/>
        </media>
      </play>
      <collect iterate="forever" cleardb="true">
        <detect>
          <send target="source" event="done" namelist="dtmf.digits" />
          <send target="group" event="terminate"/>
        </detect>
      </collect>
    </group>
  </dialogstart>
</msml>
```

Step 6d
The MS sends a 200 OK response to indicate success. The 200 OK response includes the following MSML control syntax.

```xml
<msml version="1.1">
  <result response="200"/>
  <dialogid>conn:b19d82a0-0-13c4-13cbd2-58c3964e-13cbd2 /dialog:29</dialogid>
</msml>
```

Terminate Connections

Step 7a to 7d
These steps comprise standard SIP message exchanges for the termination of the SIP dialogs between the SIP client and the AS and between the AS and MS and the termination of the media session (RTP) between the SIP client and the MS.
7. MSML Script Examples

This chapter provides sample MSML scripts. Topics include:

- MSML Scripts for Audio Conferencing
- MSML Scripts for Video Conferencing
- MSML Scripts Examples for <var> element
- MSML Scripts Examples for <transfer> element

**MSML Scripts for Audio Conferencing**

The following sections provide examples of audio conferencing tasks.

**Creating a basic audio conference with <asn> and <n-loudest>**

The following example creates a basic audio conference with up to three active talkers included in the audio mix and active speaker notification with the minimum reporting interval set to 10 seconds.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<msml version="1.1">
  <createconference name="1234" deletewhen="never">
    <audiomix id="mix1">
      <n-loudest n="3"/>
      <asn ri="10s"/>
    </audiomix>
  </createconference>
</msml>
```

**Modifying a basic audio conference with <asn> and <n-loudest>**

The following example modifies a basic audio conference to support up to five active talkers included in the audio mix and active speaker notification with the minimum reporting interval set to one second.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<msml version="1.1">
  <modifyconference id="conf:1234">
    <audiomix id="mix1">
      <n-loudest n="5"/>
      <asn ri="1s"/>
    </audiomix>
  </modifyconference>
</msml>
```

**Joining preferred party, full-duplex and listen-only parties to an audio conference**

The following example joins preferred party, full-duplex and listen-only parties to the audio conference created in example 8.1.1. The first party is the conference chair and is designated as a preferred party and will always be heard when speaking. The next five parties are also eligible to be heard when speaking based upon their audio energy levels. The last six parties are listen only parties.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<msml version="1.1">
  <join id1="conn:0001" id2="conf:1234">
    <stream media="audio" dir="from-id1" preferred="true"/>
    <stream media="audio" dir="to-id1"/>
  </join>
  <join id1="conn:0002" id2="conf:1234"/>
</msml>
```
Call center coach-pupil conference

The following example uses the audio conference created in Creating a basic audio conference with <asn> and <n-loudest> for a call center application where a customer and an agent (pupil) are connected via the conference and a supervisor (coach) is also joined to the conference. The supervisor can hear both the customer and the agent. The supervisor can only be heard by the agent. The agent is heard by both the customer and the supervisor.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<msml version="1.1">
  <join id1="conn:customer1" id2="conf:1234"/>
  <join id1="conn:agent1" id2="conf:1234">
    <stream media="audio" dir="from-id1" dlgc:conf_party_type="pupil"/>
    <stream media="audio" dir="to-id1"/>
  </join>
  <join id1="conn:supervisor1" id2="conf:1234">
    <stream media="audio" dir="from-id1" dlgc:conf_party_type="coach"/>
    <stream media="audio" dir="to-id1"/>
  </join>
</msml>
```

Setting <stream> attribute for echo cancellation

The following examples show how to enable/disable echo cancellation for participants that are joined in a conference.

Setting <stream> attribute dlgc:echo_cancel = enable using <join>

```xml
<msml version="1.1">
  <join id1="conn:jd87dfg4h" id2="conf:exampleConf">
    <stream media="audio" dir="from-id1" dlgc:echo_cancel="enable"/>
    <stream media="audio" dir="to-id1"/>
  </join>
</msml>
```

Setting <stream> attribute dlgc:echo_cancel = enable using <modifystream>

```xml
<msml version="1.1">
  <modifystream id1="conn:jd87dfg4h" id2="conf:exampleConf">
    <stream media="audio" dir="from-id1" dlgc:echo_cancel="enable"/>
  </modifystream>
</msml>
```
Setting `<stream>` attribute `dlgc:echo_cancel = disable` using `<modifystream>`

```xml
<msml version="1.1">
  <modifystream id1="conn:jd87dfg4h" id2="conf:exampleConf">
    <stream media="audio" dir="from-id1" dlgc:echo_cancel ="disable"/>
  </modifystream>
</msml>
```

Muting an audio stream flowing into a conference

This example mutes the audio stream from caller `conn:0001` flowing into a conference.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<msml version="1.1">
  <modifystream id1="conf:1234" id2=" conn:0001">
    <stream media="audio" dir="to-id1">
      <gain amt="mute"/>
    </stream>
  </modifystream>
</msml>
```

This example mutes the audio stream from the conference flowing towards caller `conn:0002`.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<msml version="1.1">
  <modifystream id1="conf:1234" id2=" conn:0002">
    <stream media="audio" dir="from-id1">
      <gain amt="mute"/>
    </stream>
  </modifystream>
</msml>
```

Un-muting an audio stream flowing into a conference

A - This example un-mutes the audio stream from caller `conn:0001` flowing into a conference using `amt="0"`.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<msml version="1.1">
  <modifystream id1="conf:1234" id2=" conn:0001">
    <stream media="audio" dir="to-id1">
      <gain amt="0"/>
    </stream>
  </modifystream>
</msml>
```

This example un-mutes the audio stream from caller `conn:0001` flowing into a conference using `amt="unmute"`.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<msml version="1.1">
  <modifystream id1="conf:1234" id2=" conn:0001">
    <stream media="audio" dir="to-id1">
      <gain amt="unmute"/>
    </stream>
  </modifystream>
</msml>
```

B - This example un-mutes the audio stream from the conference flowing towards caller `conn:0002` using `amt="0"`.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<msml version="1.1">
  <modifystream id1="conf:1234" id2=" conn:0002">
    <stream media="audio" dir="from-id1">
      <gain amt="0"/>
    </stream>
  </modifystream>
</msml>
```
C - This example un-mutes the audio stream from the conference flowing towards caller conn:0002 using amt="unmute".

```xml
<msml version="1.0" encoding="UTF-8">
  <modifyStream id1="conf:1234" id2="conn:0002">
    <stream media="audio" dir="from-id1">
      <gain amt="unmute"/>
    </stream>
  </modifyStream>
</msml>
```

**Un-joining streams using wildcards**

A - This example creates a full-duplex audio stream between conf_1234 and conn:0001, creates a half-duplex audio stream from conn:0002 to conn:0001, and creates a half-duplex audio stream from conn:0002 to conf:1234.

```xml
<msml version="1.0" encoding="UTF-8">
  <createConference name="1234" deletewhen="nomedia" term="false"/>
  <join id1="conn:0001" id2="conf:1234"/>
  <join id1="conn:0001" id2="conn:0002"/>
  <join id1="conn:0002" id2="conn:1234"/>
</msml>
```

B - After executing script A in this section, the following script un-joins all audio streams connected to conn:0001 (the full-duplex connection between conn:0001 and conf:1234 and the half-duplex stream from conn:0002 to conn:0001).

```xml
<msml version="1.0" encoding="UTF-8">
  <unjoin id1="conn:0001" id2="*"/>
</msml>
```

C - After executing script A in this section, the following script un-joins all audio streams connected to conf:1234 (the full-duplex connection between conf:1234 and conn:0001 and the half-duplex stream from conn:0002 to conf:1234).

```xml
<msml version="1.0" encoding="UTF-8">
  <unjoin id1="conf:1234" id2="*"/>
</msml>
```

D - After executing script A in this section, the following script un-joins all audio streams connected between conn:0001 and any conferencing object (the full-duplex connection between conn:0001 and conf:1234).

```xml
<msml version="1.0" encoding="UTF-8">
  <unjoin id1="conn:0001" id2="conf:*"/>
</msml>
```

E - After executing script A in this section, the following script un-joins the audio stream from conf:1234 to conn:0001.

```xml
<msml version="1.0" encoding="UTF-8">
  <unjoin id1="conf:1234" id2="*">
    <stream dir="from-id1"/>
  </unjoin>
</msml>
```
Continuous digit collection on a conference participant

This example illustrates when a call arrives at the media server, conn:0001. The following takes place:

1. A dialog (target conn:0001) is started that will collect digits one digit at a time and send an event to the application server for each digit received. This dialog executes continuously. It may be ended by the application at some point (not shown in the example).

2. A 2nd dialog (target conn:0001) is started that will play a prompt requesting the caller to enter the conference id. The prompt will be repeated up to three times.

3. The caller enters the conference id and these digits are sent to the application server.

4. The application, having received the conference id, then ends the 2nd dialog.

5. The application receives an event indicating that the play has ended and then receives the dialog.exit event for the 2nd dialog.

6. At this point, the application joins the caller (conn:0001) to the conference (conf:1234). The application will continue to receive dtmf digit events from the caller since the 1st dialog is still active.

Note: Only 1 object or dialog can be transmitting to the network object conn:0001. If the application attempted to join the caller (conn:0001) to the conference before the 2nd dialog (which had been doing a play to the caller) had exited, the join operation would have resulted in an error.

Start continuous digit collection

<?xml version="1.0" encoding="UTF-8"?>
<msml version="1.0">
  <dialogstart target="conn:0001" type="application/moml+xml" name="dtmf.detect">
    <collect iterate="forever" cleardb="true">
      <pattern digits="x">
        <send target="source" event="dtmf#pattern_detected" namelist="dtmf.last"/>
      </pattern>
    </collect>
  </dialogstart>
</msml>

Play prompt requesting conference id

<?xml version="1.0" encoding="UTF-8"?>
<msml version="1.0">
  <dialogstart target="conn:0001" type="application/moml+xml" name="play.request_conf_id">
    <play iterations="3" interval="5s" barge="false">
      <audio uri="http://host1/conf_id_request.wav"/>
      <playexit>
        <send target="source" event="playdone" namelist="play.end"/>
      </playexit>
    </play>
  </dialogstart>
</msml>

Digit events are received for conference id

<?xml version="1.0" encoding="UTF-8"?>
<msml version="1.1">
  <event name="dtmf" id="conn:0001/dialog:dtmf.detect" name="dtmf.last" value="1"/>
</event>
</msml>
End dialog playing prompt requesting conference id

```xml
<?xml version="1.0" encoding="UTF-8"?>
<msml version="1.0">
  <dialogend id="conn:0001/dialog:play.request_conf_id"/>
</msml>
```

Playdone event is received

```xml
<?xml version="1.0" encoding="UTF-8"?>
<msml version="1.1">
  <event name="playdone" id="conn:0001/dialog:play.request_conf_id">
    <name>play.end</name><value>play.terminate</value>
  </event>
</msml>
```

The dialog.exit event is received for the dialog playing prompt requesting conference id

```xml
<?xml version="1.0" encoding="UTF-8"?>
<msml version="1.1">
  <event name="msml.dialog.exit" id="conn:0001/dialog:play.request_conf_id="/>
</msml>
```

Join conn:0001 to conf:1234

```xml
<?xml version="1.0" encoding="UTF-8"?>
<msml version="1.1">
  <join id1="conn:0001" id2="conf:1234"/>
</msml>
```

Destroying a conference

This example destroys conference conf:1234.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<msml version="1.1">
  <destroyconference id="conf:1234"/>
</msml>
```

**MSML Scripts for Video Conferencing**

The following sections provide examples of video conferencing tasks.

**Creating a four party layout video conference**

This example creates a video conference using a four party layout, as shown in the following figure, with a VGA root size, since 2 of the parties (conn:0001 and conn:0003) that have called into the video conference support H.264 VGA resolution. Caller conn:0002 uses H.264 QVGA and caller conn:0004 H.263 CIF.

![Video Layout 4.1](image_url)
Expanding a four party layout to a six party layout video conference

This example modifies the video conference created in *Creating a four party layout video conference* from a four party layout to a six party layout while the four participants are still joined to the video conference.
Two additional participants are then joined to the conference, regions 5 and 6. Caller conn:0005 uses H.264 QVGA and caller conn:0006 H.263 CIF.

```xml
<msml version="1.1">
  <join id1="conn:0005" id2="conf:876123">
    <stream media="audio"/>
    <stream media="video" dir="from-id1" display="5"/>
    <stream media="video" dir="to-id1"/>
  </join>
  <join id1="conn:0006" id2="conf:876123">
    <stream media="audio"/>
    <stream media="video" dir="from-id1" display="6"/>
    <stream media="video" dir="to-id1"/>
  </join>
</msml>
```

**Contracting a six party layout to a four party layout video conference**

This example modifies the video conference in Expanding a four party layout to a six party layout video conference from a six party layout to a four party layout after two callers, caller conn:0001 and caller conn:0003, leave the conference.

Caller conn:0001 and caller conn:0003, the only VGA callers, leave the conference.

```xml
<msml version="1.1">
  <unjoin id1="conn:0001" id2="conf:876123"/>
  <unjoin id1="conn:0003" id2="conf:876123"/>
</msml>
```

The conference is modified to a four party layout with a root size of QVGA. Regions 1 and 3 are made invisible (relativesize="0") and regions 2, 4, 5, and 6 are positioned as shown in the figure above.

```xml
<msml version="1.1">
  <modifyconference id="conf:876123">
    <videolayout>
      <root size="QVGA"/>
      <region id="1" left="0" top="0" relativesize="0"/>
      <region id="2" left="0" top="0" relativesize="1/2"/>
      <region id="3" left="66.666%" top="33.333%" relativesize="0"/>
      <region id="4" left="50%" top="0" relativesize="1/2"/>
      <region id="5" left="0" top="50%" relativesize="1/2"/>
      <region id="6" left="50%" top="50%" relativesize="1/2"/>
    </videolayout>
  </modifyconference>
</msml>
```
Layered regions in a video conference

This example modifies the four party video conference established in Creating a four party layout video conference to demonstrate use of the priority attribute to overlap regions.

First, region 1 is expanded to partially overlap the other 3 regions.

Second, region 1 is reduced to its original size and region 4 is expanded to partially overlap the other 3 regions.

Single party layout video conference using a <selector> element

The following examples create a video conference using a single party layout and a <selector> element that switches the party that is displayed based upon voice energy. Four parties are added to the conference.
Creating the conference

```xml
<?xml version="1.0" encoding="UTF-8"?>
<msml version="1.1">
  <createconference name="1111" deletewhen="nomedia">
    <videolayout>
      <root size="CIF"/>
      <selector id="switch1" method="vas">
        <region id="root"/>
      </selector>
    </videolayout>
  </createconference>
</msml>
```

Joining four parties to the conference

```xml
<?xml version="1.0" encoding="UTF-8"?>
<msml version="1.1">
  <join id1="conn:0001" id2="conf:1111">
    <stream media="audio"/>
    <stream media="video" dir="from-id1" display="switch1"/>
    <stream media="video" dir="to-id1"/>
  </join>
  <join id1="conn:0002" id2="conf:1111">
    <stream media="audio"/>
    <stream media="video" dir="from-id1" display="switch1"/>
    <stream media="video" dir="to-id1"/>
  </join>
  <join id1="conn:0003" id2="conf:1111">
    <stream media="audio"/>
    <stream media="video" dir="from-id1" display="switch1"/>
    <stream media="video" dir="to-id1"/>
  </join>
  <join id1="conn:0004" id2="conf:1111">
    <stream media="audio"/>
    <stream media="video" dir="from-id1" display="switch1"/>
    <stream media="video" dir="to-id1"/>
  </join>
</msml>
```

Multiple party layout video conference using a `<selector>` element

The following examples create a video conference using a multiple party layout and a `<selector>` element that switches the party that is displayed based upon voice energy. Four parties are added to the conference.

Supporting `<selector>` in any region

```xml
<?xml version="1.0" encoding="UTF-8"?>
<msml version="1.1">
  <createconference name="1111" deletewhen="nomedia">
    <videolayout type="text/msml-basic-layout">
      <root size="CIF"/>
      <selector id="switch1" method="vas">
        <region id="1" left="0" top="0" relativesize="2/3"/>
      </selector>
      <region id="2" left="67%" top="0" relativesize="1/3"/>
      <region id="3" left="67%" top="33%" relativesize="1/3"/>
      <region id="4" left="67%" top="67%" relativesize="1/3"/>
      <region id="5" left="33%" top="67%" relativesize="1/3"/>
      <region id="6" left="0" top="67%" relativesize="1/3"/>
    </videolayout>
  </createconference>
</msml>
```
Joining four parties to the conference

<?xml version="1.0" encoding="UTF-8"?>
<msml version="1.1">
  <join id1="conn:0001" id2="conf:1111">
    <stream media="audio"/>
    <stream media="video" dir="from-id1" display="1"/>
    <stream media="video" dir="to-id1"/>
  </join>
  <join id1="conn:0002" id2="conf:1111">
    <stream media="audio"/>
    <stream media="video" dir="from-id1" display="2"/>
    <stream media="video" dir="to-id1"/>
  </join>
  <join id1="conn:0003" id2="conf:1111">
    <stream media="audio"/>
    <stream media="video" dir="from-id1" display="3"/>
    <stream media="video" dir="to-id1"/>
  </join>
  <join id1="conn:0004" id2="conf:1111">
    <stream media="audio"/>
    <stream media="video" dir="from-id1" display="4"/>
    <stream media="video" dir="to-id1"/>
  </join>
</msml>

Sequencing parties through regions in a video conference layout

For this example, a four-party layout is created as shown in Creating a four party layout video conference. A total of 16 parties will participate in the conference. Each region will be used to display four parties sequentially where each party will be visible for three seconds.

Parties are joined to the conference as they arrive as follows.

Join 16 parties (conn:0001 through conn:0016) as they arrive.

- Parties: 1 (conn:0001), 5, 9, and 13 get joined to region 1.
- Parties: 2 (conn:0002), 6, 10, and 14 get joined to region 2.
- Parties: 3 (conn:0003), 7, 11, and 15 get joined to region 3.
- Parties: 4 (conn:0004), 8, 12, and 16 get joined to region 4.

Sending scripts with <unjoin> elements before doing the next <join> is not necessary. The last party joined to a region is the one that will be visible in that region.

Connect party 1 to region 1 as follows.

```
<?xml version="1.0" encoding="UTF-8"?>
<msml version="1.1">
  <join id1="conn:0001" id2="conf:876123">
    <stream media="audio"/>
    <stream media="video" dir="from-id1" display="1"/>
    <stream media="video" dir="to-id1"/>
  </join>
</msml>
```

To sequence through parties in a region, use <modifystream>. Sequence through parties 1, 5, 9, and 13 in region 1 displaying each party for approximately three seconds before displaying the next party.
Step A:

<?xml version="1.0" encoding="UTF-8"?>
<msml version="1.1">
  <modifystream id1="conn:0001" id2=" conf:876123 ">
    <stream media="video" dir="from-id1" display="1"/>
    <stream media="video" dir="to-id1"/>
  </modifystream>
</msml>

Party 1 is now displayed in region 1. Wait three seconds and then proceed to Step B.

Step B:

<?xml version="1.0" encoding="UTF-8"?>
<msml version="1.1">
  <modifystream id1="conn:0005" id2=" conf:876123">
    <stream media="video" dir="from-id1" display="1"/>
    <stream media="video" dir="to-id1"/>
  </modifystream>
</msml>

Party 5 is now displayed in region 1. Wait three seconds and then do Step C.

Step C:

<?xml version="1.0" encoding="UTF-8"?>
<msml version="1.1">
  <modifystream id1="conn:0009" id2=" conf:876123">
    <stream media="video" dir="from-id1" display="1"/>
    <stream media="video" dir="to-id1"/>
  </modifystream>
</msml>

Party 9 is now displayed in region 1. Wait three seconds and then do Step D.

Step D:

<?xml version="1.0" encoding="UTF-8"?>
<msml version="1.1">
  <modifystream id1="conn:0013" id2=" conf:876123">
    <stream media="video" dir="from-id1" display="1"/>
    <stream media="video" dir="to-id1"/>
  </modifystream>
</msml>

Party 13 is now displayed in region 1. Wait three seconds and then repeat Step A through Step D until all parties are sequenced.

Recording a segment of a video conference

<?xml version="1.0" encoding="utf-8" ?>
<msml version="1.1">
  <dialogstart target="conf:1234" type="application/moml+xml" name="DlgID">
    <record id="record1" maxtime="60s" audiodest="file:///root/ms/media/record1.pcm"
      videodest="file:///root/ms/media/record1.vid"
      format="video/proprietary;codecs=linear,h264" audiosamplesize="16"/>
  </dialogstart>
</msml>

Playing audio into a video conference

<?xml version="1.0" encoding="UTF-8" ?>
<msml version="1.1">
  <dialogstart target="conf:1234" type="application/moml+xml">
    <play barge="false">
      <audio uri="file:///testing/media/conf_to_end.wav"/>
    </play>
  </dialogstart>
</msml>
Voice activated switching

The following examples show voice activated switching ("vas").

Creating a video conference

```xml
<?xml version="1.0" encoding="UTF-8"?>
<msml version="1.1">
<createconference name="1234" deletewhen="nomedia">
<videolayout>
<root size="VGA"/>
<region id="1" left="0" top="0" relativesize="1/2"/>
<region id="2" left="50%" top="0" relativesize="1/2"/>
<region id="3" left="0%" top="50%" relativesize="1/2"/>
<region id="4" left="50%" top="50%" relativesize="1/2"/>
</videolayout>
</createconference>
</msml>
```

Joining parties to the conference

```xml
<?xml version="1.0" encoding="UTF-8"?>
<msml version="1.1">
<join id1="conn:1234" id2="conf:1234">
<stream media="audio"/>
<stream media="video" dir="from-id1" display="1"/>
<stream media="video" dir="to-id1"/>
</join>
</msml>
```

Modifying the conference to six region layout with first region displaying active speaker

```xml
<?xml version="1.0" encoding="utf-8"?>
<msml version="1.1">
<modifyconference id="1234">
<videolayout>
<selector id="switch" method="vas">
<region id="1" left="0" top="0" relativesize="2/3"/>
</selector>
<region id="2" left="67%" top="0" relativesize="1/3"/>
<region id="3" left="67%" top="33%" relativesize="1/3"/>
<region id="4" left="67%" top="67%" relativesize="1/3"/>
<region id="5" left="33%" top="67%" relativesize="1/3"/>
<region id="6" left="0" top="67%" relativesize="1/3"/>
</videolayout>
</modifyconference>
</msml>
```

Restoring the conference back to static setting

```xml
<?xml version="1.0" encoding="utf-8"?>
<msml version="1.1">
<modifyconference id="1234">
<videolayout>
<region id="1" left="0" top="0" relativesize="1/2"/>
<region id="2" left="50%" top="0" relativesize="1/2"/>
<region id="3" left="0%" top="50%" relativesize="1/2"/>
<region id="4" left="50%" top="50%" relativesize="1/2"/>
</videolayout>
</modifyconference>
</msml>
```
MSML Scripts Examples for <var> element

The following sections provide examples of using the <var> element.

Playing the prompt for date

Demonstrates playing the prompt for date with a subtype of "mdy".

```xml
<?xml version="1.0" encoding="UTF-8"?>
<msml version="1.1">
  <dialogstart target="conn:1234" type="application/moml+xml" name="sample">
    <play>
      <var type="date" subtype="mdy" value="20030601"/>
    </play>
    <send target="source"
      event="done"
      namelist="play.amt play.end"/>
  </dialogstart>
</msml>
```

Playing the prompt for digits

Demonstrates playing the prompt for digits with a subtype of "gen".

```xml
<?xml version="1.0" encoding="UTF-8"?>
<msml version="1.1">
  <dialogstart target="conn:1234" type="application/moml+xml" name="sample">
    <play>
      <var type="digits" subtype="gen" value="9739676200" xml:lang="en-us"/>
    </play>
    <send target="source"
      event="done"
      namelist="play.amt play.end"/>
  </dialogstart>
</msml>
```

Playing the prompt for duration

Demonstrates playing the prompt for duration with a subtype of "hrs".

```xml
<?xml version="1.0" encoding="UTF-8"?>
<msml version="1.1">
  <dialogstart target="conn:1234" type="application/moml+xml" name="sample">
    <play>
      <var type="duration" subtype="hrs" value="2563145"/>
    </play>
    <send target="source"
      event="done"
      namelist="play.amt play.end"/>
  </dialogstart>
</msml>
```

Playing the prompt for money

Demonstrates playing the prompt for money with a subtype of "usd".

```xml
<?xml version="1.0" encoding="UTF-8"?>
<msml version="1.1">
  <dialogstart target="conn:1234" type="application/moml+xml" name="sample">
    <play>
      <var type="money" subtype="usd" value="0125"/>
    </play>
    <send target="source"
      event="done"
      namelist="play.amt play.end"/>
  </dialogstart>
</msml>
```
Playing the prompt for month

<?xml version="1.0" encoding="UTF-8"?>
<msml version="1.1">
<dialogstart target="conn:1234" type="application/moml+xml" name="sample">
<play>
<var type="month" subtype="" value="2"/>
</play>
<send target="source"
  event="done"
  namelist="play.amt play.end"/>
</dialogstart>
</msml>

Playing the prompt for number

Demonstrates playing the prompt for number with a subtype of "crd".

<?xml version="1.0" encoding="UTF-8"?>
<msml version="1.1">
<dialogstart target="conn:1234" type="application/moml+xml" name="sample">
<play>
<var type="number" subtype="crd" value="511"/>
</play>
<send target="source"
  event="done"
  namelist="play.amt play.end"/>
</dialogstart>
</msml>

Playing the prompt for silence

<?xml version="1.0" encoding="UTF-8"?>
<msml version="1.1">
<dialogstart target="conn:1234" type="application/moml+xml" name="sample">
<play>
<var type="silence" subtype="" value="5"/>
</play>
<send target="source"
  event="done"
  namelist="play.amt play.end"/>
</dialogstart>
</msml>

Playing the prompt for time

Demonstrates playing the prompt for time with a subtype of "t12".

<?xml version="1.0" encoding="UTF-8"?>
<msml version="1.1">
<dialogstart target="conn:1234" type="application/moml+xml" name="sample">
<play>
<var type="time" subtype="t12" value="1750"/>
</play>
<send target="source"
  event="done"
  namelist="play.amt play.end"/>
</dialogstart>
</msml>
Playing the prompt for weekday

```xml
<?xml version="1.0" encoding="UTF-8"?>
<msml version="1.1">
  <dialogstart target="conn:1234" type="application/moml+xml" name="sample">
    <play>
      <var type="weekday" subtype="" value="2" xml:lang="eng"/>
    </play>
    <send target="source" event="done" namelist="play.amt play.end"/>
  </dialogstart>
</msml>
```

Playing the prompt for string

```xml
<?xml version="1.0" encoding="UTF-8"?>
<msml version="1.1">
  <dialogstart target="conn:1234" type="application/moml+xml" name="sample">
    <play>
      <var type="string" subtype="" value="7adfHLL34kh" xml:lang="zh-cn"/>
    </play>
    <send target="source" event="done" namelist="play.amt play.end"/>
  </dialogstart>
</msml>
```

MSML Scripts Examples for `<transfer>` element

The following sections provide examples of using the `<transfer>` element.

**PUT a file**

```xml
<?xml version="1.0" encoding="UTF-8"?>
<msml version="1.1">
  <dialogstart target="conn:1234" type="application/moml+xml" name="12345">
    <transfer>
      <fileobj src="file://verification/verification_intro.wav" dest="http://server.example.com/media/verification_intro.wav" />
      <transferexit>
        <send target="source" event="done" namelist="transfer.duration transfer.end"/>
      </transferexit>
    </transfer>
  </dialogstart>
</msml>
```

**Local file delete**

```xml
<?xml version="1.0" encoding="UTF-8"?>
<msml version="1.1">
  <dialogstart target="conn:1234" type="application/moml+xml" name="12345">
    <transfer>
      <fileobj delete="true" src="file://verification/verification_intro.wav"/>
    </transfer>
  </dialogstart>
</msml>
```

**Local file copy**

```xml
<?xml version="1.0" encoding="UTF-8"?>
<msml version="1.1">
  <dialogstart target="conn:1234" type="application/moml+xml" name="12345">
    <transfer>
      <fileobj src="file://verification/verification_intro.wav" dest="file://verification/copy_of_verification_intro.wav"/>
    </transfer>
  </dialogstart>
</msml>
```
Transfer file over MSRP and delete it (example in SIP INFO payload with content id)

Content-Type: Multipart/Related; boundary=example-1
start="<950120.aaCC@XIson.com>";
type="application/xml"

--example-1

8. Appendix A: Media Server Markup Language (MSML) Overview

This chapter provides a brief overview of the Media Server Markup Language (MSML). The descriptions are based on Media Server Markup Language (MSML), RFC 5707 and are considered the nominal. Topics include:

- Introduction
- MSML Elements
- Stream Manipulation Elements
- Conference Elements
- Dialog Elements
- Receiving Events from a Client
- Sending Events and Transaction Results to a Client
- Media Server Object Model
- Media File Formats

Introduction

The Media Server Markup Language (MSML) is an Extensible Markup Language (XML) used to control the flow of media streams and services applied to media streams within a media server. It provides a means to configure, define and control media resource objects to construct many different types of services on individual sessions, groups of sessions, and conferences. MSML allows the creation of conferences, bridging different sessions together, and bridging sessions into conferences. Additionally MSML facilitates the use of complex interactions between media objects and constructs to create and control media processing operations used for application interactions with end users (e.g., announcements, Interactive voice response (IVR, IVVR), play and record, automatic speech recognition (ASR), text to speech (TTS)).

Readers who want an in-depth understanding of the control language should refer to RFC 5707.

Note: The current implementation of the MSML Media Server Software does not support all the capabilities of MSML.
**MSML Elements**

MSML commands are sent from a client to the MS via SIP messages (most notably the INFO message). The body of the SIP message contains the XML control syntax.

**<msml>**

The root XML element of MSML is `<msml>`. It defines the set of operations that form a single MSML transaction.

Results or events returned to the client are also enclosed in the `<msml>` element.

**<send>**

The `<send>` element is used by a client to send an event to the MS.

**<result>**

The `<result>` element is used by the MS to report the results of an MSML transaction requested by a client.

**<event>**

The `<event>` element is used by the MS to notify a client of an event.

**Stream Manipulation Elements**

The following subsections describe the elements that establish, modify, and remove streams.

**Note:** The `<monitor>` element described in MSML IETF draft, version -06 is not currently supported.

**<join>**

The `<join>` element is used to create one or more streams between two independent objects. Streams may be audio or video and may be unidirectional or bidirectional.

**<modifystream>**

The `<modifystream>` element is used to change the properties of a stream. The `<modifystream>` element can have different properties such as the gain for an audio stream or a visual label for a video stream.

**<unjoin>**

The `<unjoin>` element is used to remove one or more existing media streams between two objects.
Conference Elements
The following subsections describe the elements that establish, modify, and destroy conferences.

<createconference>
The <createconference> element is used to create a conference. The MS assigns a conference name if the name attribute is not included.

Note: Only audio conferences are currently supported.

<modifyconference>
The <modifyconference> element is used to change the properties of a conference, such as the active talker interval.

<destroyconference>
The <destroyconference> element is used to delete an existing conference.

Dialog Elements
Dialogs are used for interaction with a user.

<dialogstart>
The <dialogstart> element is used to instantiate a media dialog on connections or conferences.

The following attributes for <dialogstart> are Dialogic extensions of RFC 5707.

<table>
<thead>
<tr>
<th>Attributes</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dlgc:target_display</td>
<td>Optional. This is a Dialogic extension. This is an attribute that allows a &lt;dialogstart&gt; element to be directed to a specific display region. This attribute is used only when the &quot;target&quot; attribute is set to be a conference connection (conf:xxxx). In this configuration, the attribute allows a video play media operation to be directed to a specific display region. If dlgc:target_display is not defined, the video will be played to a root of a conference.</td>
</tr>
</tbody>
</table>

<dialogend>
The <dialogend> element is used to terminate a dialog created through <dialogstart>.

Receiving Events from a Client
Events are received from clients via SIP INFO messages. Events are used to affect the behavior of different objects within the MS. The client includes the <send> element within the <msml> root element. The <send> element identifies the event to process.
Sending Events and Transaction Results to a Client

Transaction Results
The `<result>` element is used to report the results of an MSML transaction. The `<result>` element is included in the final response to the SIP INFO message that initiated the transaction.

Events
The `<event>` element is used to notify the MS client of an event. Events are sent to clients via SIP INFO messages.

Media Server Object Model
Media server objects represent entities that source, sink, or modify media streams. A media stream is a unidirectional or bidirectional media flow between objects in a MS.

The MS object classes are:
- Network Connections (conn)
- Conference (conf)
- Dialog (dialog)
- Operator (oper)

Network Connections (conn)
Definition
A Network Connection is an object or class defined in the MSML specification. Network Connection is an abstraction for the media processing resources involved in terminating the RTP session(s) of a call. For audio services, a connection instance presents a full-duplex audio stream interface within a MS. Multimedia connection objects have multiple media streams of different media types, each corresponding to an RTP session. MSML Network Connection instances are instantiated through SIP.

Object Creation
Unlike other MSML objects that are created using MSML commands/elements, Network Connection objects are not created using MSML commands/elements. Network Connections are created when media sessions get established through SIP call control. The connection identifier is not assigned by the AS. It is assigned by the MS and is returned to the AS in the response to the initial INVITE received from the AS. Specifically, this is the "tag" value included in the "To" header in the response. The format of the connection identifier is "conn:<tag value>".

Figure 3 shows the interactions between the MS and the AS to create a Network Connection and establish an object identifier.
Conference (conf)

Definition

A Conference is an object or class defined in the MSML specification that allows for audio/video mixing and other advanced conferencing services. A conference represents the media resources and state information required for a single logical mix of each media type in the conference (for example, audio and video). A conference has a single logical output per media type. For each participant, it consists of the audio conference mix, less any contributed audio of the participant, and the video mix shared by all conference participants.

Note: In Figure 3, the identifier used by the MS and AS to reference the network connection is "conn:74jgd63956ts".
**Object Creation**

Conferences are created using the `<createconference>` MSML command. The conference name can be assigned by the AS or, if the AS does not specify a name, the MS assigns one. Both the AS and the MS reference to the conference using the name as the id, `conf="name"`.

The AS can request that a MS automatically delete a conference when a specified condition occurs by using the `deletewhen` attribute. A value of "nomedia" indicates that the conference must be deleted when there are no remaining participants in the conference. When this occurs, an "msml.conf.nomedia" event must be notified to the MSML client. A value of "nocontrol" indicates that the conference must be deleted when the SIP dialog that carries the `<createconference>` element is terminated. When this occurs, a MS must terminate all participant dialogs by sending a BYE for their associated SIP dialog. A value of "never" must leave the ability to delete a conference under the control of the MSML client.

Additional content of the `<createconference>` element specifies the parameters of the audio and/or video mixes.

An example of the creation of an audio conference is shown below. This conference reports the set of active speakers no more frequently than every 10 seconds.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<msml version="1.1">
  <createconference name="example">
    <audiomix>
      <asn ri="10s"/>
    </audiomix>
  </createconference>
</msml>
```

**Dialog (dialog)**

**Definition**

Dialogs are a class of objects that represent automated participants. Dialogs are similar to network connections from a media flow perspective and may have one or more media streams as the abstraction for their interface within the MS. Unlike network connections, dialogues are created and destroyed through MSML. The MS implements the dialog participant.

A Dialog is a generic reference to the set of resources, both media and control, which are used to create a simple or complex action. An atomic play or record is an example of a simple action.

The function that a Dialog instance fulfills is defined by a client and the language utilized. In this case, it is MOML.

MSML Dialog instances are instantiated through the `<dialogstart>` element.

**Object Creation**

All MSML objects except the Network Connection objects are created using MSML commands/elements.

The following example starts a MOML dialog on a connection.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<msml version="1.1">
  <dialogstart target="conn:abcd1234" type="application/moml+xml"
    name="sample"
    src="http://server.example.com/scripts/foo.moml"/>
</msml>
```
Operator (oper)

Definition
An Operator is an object or class used to filter or transform a media stream. Operators have a media type and may be unidirectional or bidirectional.

Unidirectional operators reflect simple atomic functions, such as automatic gain control or filtering tones. Unidirectional operators have a single media input that is connected to the media stream from one object, and a single media output that is connected to the media stream of a different object.

Bidirectional operators have two media inputs and two media outputs. One media input and output is associated with the stream to one object, and the other input and output is associated with a stream to a different object.

The function that an Operator instance fulfills is defined by a client and the language utilized. In this case, it is MOML.

MSML Operator instances are instantiated when streams are created using a <join> element or modified using a <modifystream> element.

Object Creation
All MSML objects except Network Connection objects are created using MSML commands/elements.

Media File Formats
The following section details the supported media containers and codecs. When selecting appropriate values for the <audio> or <video> element format attribute, refer to Media File Formats.

PowerMedia XMS has the ability to use the codec from the incoming stream(s) to record media into a container. From the MSML perspective, it is enabled by using codec=native for the containers that support codec=.

When playing media from a container that includes a header describing the media (AUD and WAV formats), the codecs=, audiosamplesize, and audiosamplerate attributes are not required and will be ignored if specified.

When playing media from a http:// uri, the web server must be configured to supply the appropriate MIME type for the media in order for PowerMedia XMS to play the media. To select the appropriate MIME type for your media, refer to Media File Formats.

When recording audio and video, the filetype must be specified as video/proprietary. Since RFC 5707 only allows for one container specification, the audio container is inferred from the file extension. For the appropriate file extension specification for each supported audio container, refer to Media File Formats.

For example, the audio container (raw) is determined from the file extension of the audio destination:

```xml
<?xml version="1.0" encoding="utf-8" ?>
<msml version="1.1">
  <dialogstart target="conf:exampleConf" type="application/moml+xml" name="DlgID">
    <record id="record1" maxtime="60s" audiodest=file:///root/mserver/record1.pcm videodest=file:///root/mserver/record1.vid format="video/proprietary;codecs=linear,native" audiosamplerate="8" audiosamplesize="16"/>
  </dialogstart>
</msml>
```
When recording video using `<record>`, all video format parameters must be specified or none should be specified. If none specified, defaults from the stream being recorded will be used. A partial or incomplete format specification will not be accepted.

**Table 15. Media File Formats**
